

# MCAL User Manual for Spi

## 32-bit TriCore™ AURIX™ TC3xx microcontroller

### About this document

#### Scope and purpose

This User Manual is intended to enable users to integrate the Microcontroller Abstraction Layer (MCAL) software for the TriCore™ AURIX™ family of 32-bit microcontrollers.

This document describes responsibilities of integrator in-charge of integrating MCAL software with the basic software (BSW) stack. This document also provides detailed information on safety, configuration and functions along with examples of usage of significant features.

*Note:* Detailed information about package installation, safety and other generic information that are common across all modules are provided in MCAL User Manual General.

#### Intended audience

This document is intended for anyone using the Spi module of the TC3xx MCAL software.

#### Document conventions

**Table 1** Conventions

Convention	Explanation
<b>Bold</b>	Emphasizes heading levels, column headings, table and figure captions, screen names, windows, dialog boxes, menus, sub-menus
<i>Italics</i>	Denotes variable(s) and reference(s)
Courier	Denotes APIs, functions, interrupt handlers, events, data types, error handlers, file/folder names, directories, command line inputs, code snippets
New	
>	Indicates that a cascading sub-menu opens when you select a menu item
[cover parentID=<alpha numeric value>]	Used for traceability completeness. Reader should ignore these.

#### Reference documents

This User Manual should be read in conjunction with the following documents:

- AURIX™ TC3xx MCAL User Manual General
- Specification of SPI Driver, AUTOSAR\_SWS\_SPI\_Driver, AUTOSAR Release 4.2.2
- Specification of SPI Driver, AUTOSAR\_SWS\_SPI\_Driver, AUTOSAR Release 4.4.0

## 1 Spi driver

# 1 Spi driver

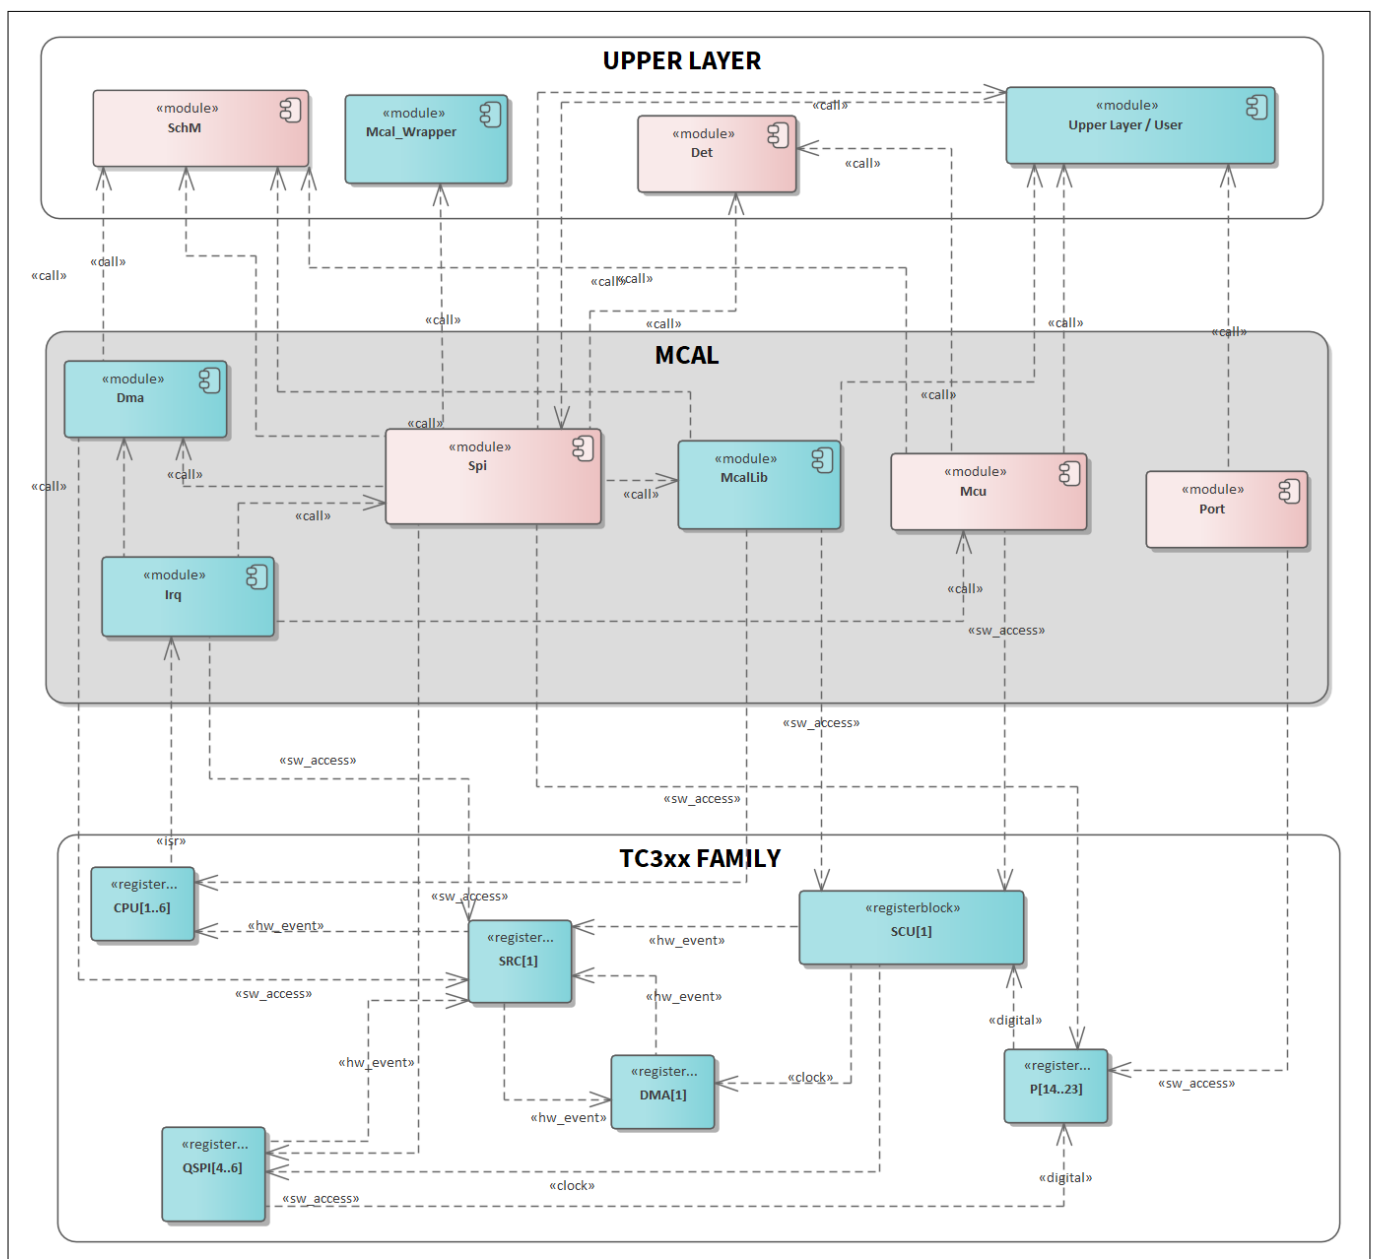

## 1.1 User information

### 1.1.1 Description

The SPI driver operates in the master and full duplex communication modes only. The driver supports synchronous and asynchronous communication supporting Level-0, Level-1 and Level-2 type configurations.

### 1.1.2 Hardware-software mapping

This section describes the system view of the SPI driver and peripherals administered by it.

**Figure 1 Mapping of hardware-software interfaces**

## 1 Spi driver

### 1.1.2.1 QSPI: primary hardware peripheral

#### Hardware functional features

The SPI driver uses the QSPI for Synchronous and Asynchronous data transfer. The key hardware functional features used by the driver are:

- QSPI FIFOs (Tx and Rx) are configured to work in the continuous data mode
- QSPI FIFOs (Tx and Rx) interrupts are configured to work in the single move mode
- SPI driver uses the QSPI move counter mode during asynchronous data transfer

The unsupported features of the QSPI are:

- High speed input capture
- Slave mode
- Long data block transfer
- ASCLIN
- MIX entry

#### Users of the hardware

The SPI driver exclusively utilizes the QSPI module.

#### Hardware diagnostic features

The SMU alarms configured for the QSPI are not monitored by the SPI driver.

#### Hardware events

The SPI driver uses the following hardware events from the QSPI IP:

- On a transmitter FIFO event - TXF
- On a receiver FIFO event - RXF
- On an error condition (TxFIFO underflow / overflow, RxFIFO underflow / overflow, Expect timeout, parity error) - ERRORFLAGS
- On phase transition (end of frame) - PT2

### 1.1.2.2 SRC: dependent hardware peripheral

#### Hardware functional features

The SPI driver depends on the interrupt router for raising an interrupt to the CPU or DMA based on the transmit FIFO event, receive FIFO event, error conditions and Phase transition, which indicates the status of data transmission and reception.

#### Users of the hardware

The interrupt router is configured either by the IRQ driver or the user software.

#### Hardware diagnostic features

The SMU alarms configured for the interrupt router are not monitored by the SPI driver.

#### Hardware events

The interrupt events raised by the interrupt router are serviced by the CPU or DMA. The SPI driver provides interrupt handlers as software interfaces, which must be invoked from the ISR.

## 1 Spi driver

### 1.1.2.3 DMA: dependent hardware peripheral

#### Hardware functional features

The SPI driver uses the DMA in the Linked list mode for the transmission and reception of data in the Asynchronous mode (Level-1, 2) of transfer. The SPI driver uses the interface APIs provided by the DMA driver to use the DMA functionality.

#### Users of the hardware

The DMA module is exclusively owned by the DMA driver, but the functionality is shared by many MCAL drivers. The DMA module is triggered for every element transmitted or received on the QSPI interface.

#### Hardware diagnostic features

The move engine (ME) error is enabled during the data transmission.

#### Hardware events

If any ME error is encountered during the data transfer then the DMA raises an error which is handled by the DMA driver.

If a channel transfer completion event occurs, DMA notifies SPI module by invoking Spi\_QspiDmaCallout which triggers the next SPI channel transmission.

### 1.1.2.4 SCU: dependent hardware peripheral

#### Hardware functional features

The SPI driver depends on the SCU IP for the clock, ENDINIT and reset functionalities. The driver requires the fSPB, fQSPI clock signals for functioning.

#### Users of the hardware

The SCU IP supplies clock for all the peripherals and the MCU driver is responsible for configuring the clock tree. To avoid conflicts due to simultaneous writes, update to all the ENDINIT protected registers is performed using the MCALLIB APIs.

#### Hardware diagnostic features

The SMU alarms configured for the SCU IP are not monitored by the SPI driver.

#### Hardware events

Hardware events from the SCU are not used by the SPI driver.

### 1.1.2.5 PORT: dependent hardware peripheral

#### Hardware functional features

- The MOSI, MISO, SCLK and SLSO signals are routed to the QSPI through the port pads. MOSI, MISO, SCLK and SLSO configured and enabled through the PORT driver
- For CS\_VIA\_GPIO, the PORT registers are directly accessed by the SPI driver for asserting/de asserting the chip select (SLSO)

#### Users of the hardware

The port pads are configured by the PORT driver.

#### Hardware diagnostic features

Not applicable.

### 1 Spi driver

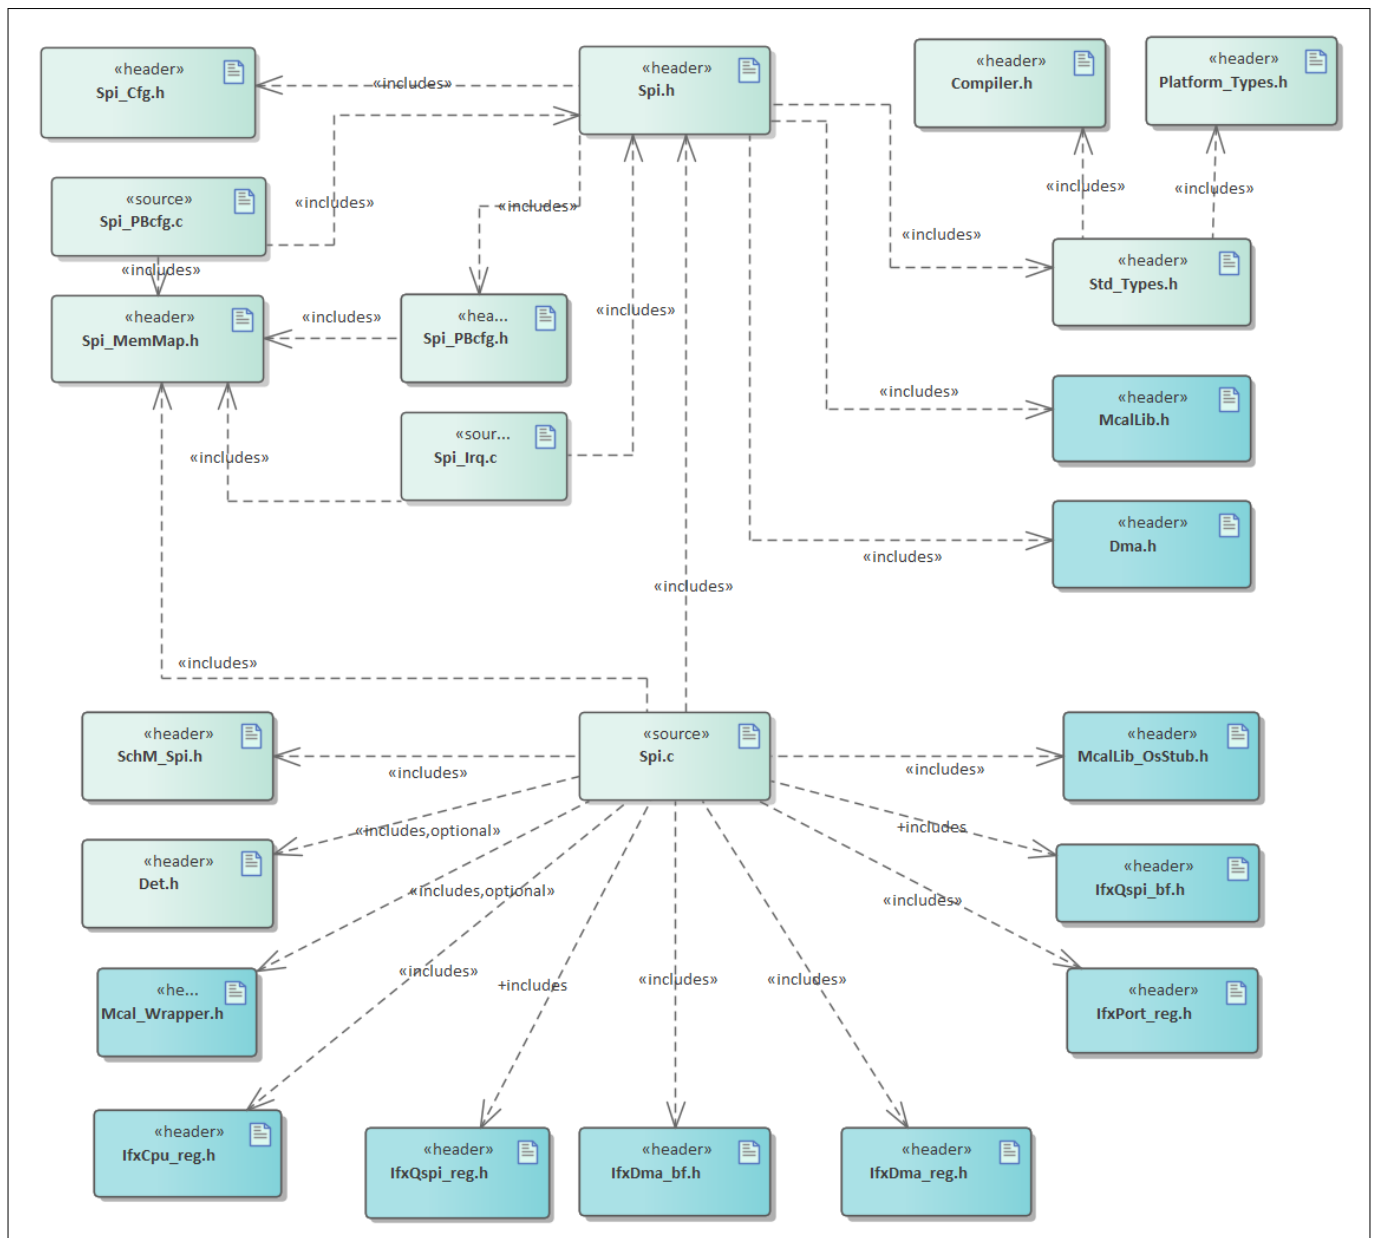

#### Hardware events

Hardware events from port pads are not used by the SPI driver.

#### 1.1.3 File structure

##### 1.1.3.1 C file structure

This section provides details of the C files of the SPI driver.

**Figure 2** Spi\_C\_File\_Structure-1.png

## 1 Spi driver

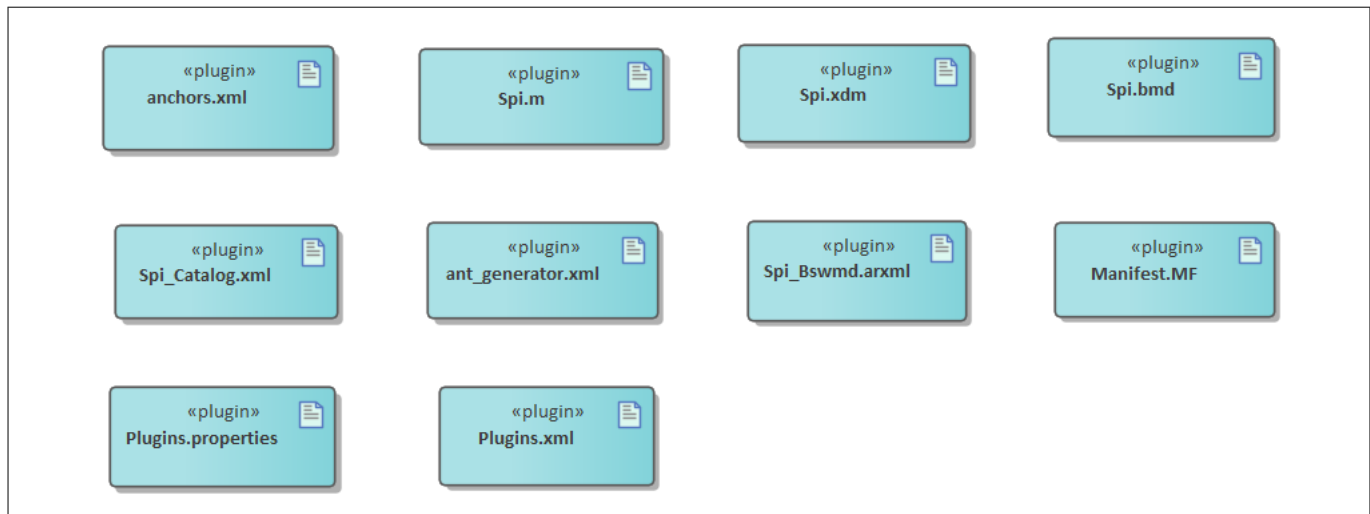

**Table 2 C file structure**

File name	Description
Compiler.h	Provides abstraction from compiler-specific keywords
Det.h	Provides the exported interfaces of Development Error Tracer
Dma.h	Header file (static) defining prototypes of data structures and APIs
IfxCpu_reg.h	SFR header file for CPU
IfxDma_bf.h	SFR header file for DMA
IfxDma_reg.h	SFR header file for DMA
IfxPort_reg.h	SFR header file for Port
IfxQspi_bf.h	SFR header file for QSPI
IfxQspi_reg.h	SFR header file for QSPI
McalLib.h	Static header file defining prototypes of data structure and APIs exported by the MCALLIB.
McalLib_OsStub.h	McalLib_OsStub.h provides macros to support user mode of Tricore. This shall be included by other drivers to call OS APIs.
Mcal_Wrapper.h	Provides the exported interfaces for Production Error and Runtime Development Errors. Implemented by default to include functions of Dem.h and Det.h files. This file can be modified by the user but function prototype is not user modifiable.
Platform_Types.h	Platform-specific type declaration file as defined by AUTOSAR
SchM_Spi.h	Export Header for SchM functions of SPI driver. Functions to protect the critical sections.
Spi.c	File (Static) containing implementation of APIs
Spi.h	Header file (Static) defining prototypes of data structures and APIs
Spi_Cfg.h	Header file (Generated) containing constants and pre-processor macros
Spi_Irq.c	IRQ file for handling all QSPI interrupts.
Spi_MemMap.h	Memmap file is used to define the section of memory to which variables or constants will be placed
Spi_PBcfg.c	File (Generated) containing objects to data structures
Spi_PBcfg.h	File (Generated) containing declaration of the post-build configuration data structures
Std_Types.h	Standard type declaration file as defined by AUTOSAR. It is independent of compiler or platform.

### 1.1.3.2 Code generator plugin files

This section provides details of the code generator plugin files of the SPI driver.

## 1 Spi driver

**Figure 3** Spi\_Code\_Generator\_Plugin\_Files-1.png

**Table 3** Code generator plugin files

File name	Description
Manifest.MF	Tresos plugin support file containing the metadata for SPI driver
Plugins.properties	Tresos plugin support file for the SPI driver
Plugins.xml	Tresos plugin support file for the SPI driver
Spi.bmd	AUTOSAR format XML data model schema
Spi.m	Macros for XDM logic verification
Spi.xdm	Tresos format XML data model schema file
Spi_Bswmd.arxml	AUTOSAR format module description file
Spi_Catalog.xml	AUTOSAR format catalogue file
anchors.xml	Tresos anchors support file for the SPI driver
ant_generator.xml	Tresos support file to generate and rename multiple post-build configuration when using variation point

### 1.1.4 Integration hints

This section describes the key points that an integrator or user of the SPI driver must consider.

#### 1.1.4.1 Integration with AUTOSAR stack

This section lists the modules, which are not part of the MCAL, but are required to integrate the SPI driver.

- **EcuM**

The ECU Manager module is a part of the AUTOSAR stack that manages common aspects of ECU. Specifically, in the context of MCAL, EcuM is used for initialization and de-initialization of the software drivers. The EcuM module provided in the MCAL package is a stub code and needs to be replaced with a complete EcuM module during the integration phase.

- **Memory mapping**

Memory mapping is a concept from AUTOSAR that allows relocation of text, variables, constants and configuration data to user-specific memory regions. To achieve this, all the re-locatable elements of the

## 1 Spi driver

driver are encapsulated in different memory-section macros. These macros are defined in the `Spi_MemMap.h` file.

The `Spi_MemMap.h` file is provided in the MCAL package as a stub code. The integrator must place appropriate compiler pragmas within the memory-section macros. The pragmas ensure that the elements are re-located to the correct memory region. A sample implementation listing the memory-section macros is shown as follows.

```
#if defined SPI_START_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
/*****User pragmas here for Non-cached LMU*****/
#undef SPI_START_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#undef MEMMAP_ERROR
#elif defined SPI_STOP_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#ifdef _TASKING_C_TRICORE_
/*****User pragmas here for Non-cached LMU*****/
#undef SPI_STOP_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#undef MEMMAP_ERROR
/**** CORE[x] CONFIG DATA -- PF[x] ****/ /*[x]=0..5*/
#elif defined SPI_START_SEC_CONFIG_DATA_ASIL_B_CORE[x]_UNSPECIFIED
/*****User pragmas here for PF[x]*****/
#undef SPI_START_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
#undef MEMMAP_ERROR
#elif defined SPI_STOP_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
/*****User pragmas here for PF[x]*****/
#undef SPI_STOP_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
#undef MEMMAP_ERROR
/**** CODE -- PF[x] ****/
#elif defined SPI_START_SEC_CODE_ASIL_B_GLOBAL
/*****User pragmas here for PF[x]*****/
#undef SPI_START_SEC_CODE_ASIL_B_GLOBAL
#undef MEMMAP_ERROR
#elif defined SPI_STOP_SEC_CODE_ASIL_B_GLOBAL
/*****User pragmas here for PF[x]*****/
#undef SPI_STOP_SEC_CODE_ASIL_B_GLOBAL
#undef MEMMAP_ERROR
#endif

#if defined MEMMAP_ERROR
#error "Spi_MemMap.h, wrong pragma command"
#endif
```

- **DET:**

The DET module is a part of the AUTOSAR stack that handles all the development errors reported by the BSW modules. The SPI driver reports all the development errors to the DET module through the `Det_ReportError()` API. The user of the SPI driver must process all the errors reported to the DET module through the `Det_ReportError()` API. The files `Det.h` and `Det.c` are provided in the MCAL package as a stub code and needs to be replaced with a complete DET module during the integration phase.

- **Mcal\_Wrapper:**

This Driver performs reporting of the Production and Runtime errors. The handling of the reported errors shall be done by the user. The `Mcal_Wrapper_Det_ReportRuntimeError()` API, `Mcal_Wrapper_Dem_ReportErrorStatus()` API and `Mcal_Wrapper_Dem_SetEventStatus()` API are provided in the `Mcal_Wrapper.h` and `Mcal_Wrapper.c` files as a stub code and can be updated by the integrator to handle

## 1 Spi driver

the reported errors. The files `Mcal_Wrapper.h` and `Mcal_Wrapper.c` are user modifiable but the function prototype is not user modifiable and by default the `Mcal_Wrapper` function shall call AUTOSAR DEM and DET modules.

The user of the SPI driver shall process all the production errors (fail/pass) and Runtime errors reported to the `Mcal_Wrapper` module. The interface used for reporting Production error in AUTOSAR version 4.2.2 is `Mcal_Wrapper_Dem_ReportErrorStatus()` and for AUTOSAR version 4.4.0 is `Mcal_Wrapper_Dem_SetEventStatus()`, for reporting runtime error is `Mcal_Wrapper_Det_ReportRuntimeError()` API. The `Mcal_Wrapper.h` and `Mcal_Wrapper.c` files are provided in the MCAL package as a stub code and can be replaced with user specific production and runtime error handling module/s during the integration phase.

*Note: Reentrancy of the `Spi_SyncTransmit` API is dependent on the reentrancy of `Mcal_Wrapper_Dem_ReportErrorStatus()` API in AUTOSAR version 4.2.2 and `Mcal_Wrapper_Dem_SetEventStatus()` API in AUTOSAR version 4.4.0. As per their design, the modules APIs are reentrant for different hardware units. However, in case `Mcal_Wrapper_Dem_ReportErrorStatus()` API and `Mcal_Wrapper_Dem_SetEventStatus()` API is implemented as non-reentrant, the APIs inherit the property of the same.*

- **SchM:**

The SchM module is a part of the RTE that manages the BSW Scheduler. The SPI driver uses the exclusive areas defined in `SchM_Spi.h` file to protect the SFRs and variables from concurrent accesses from different threads. The SchMs identified for the SPI driver are:

- Queue\_Update
- SyncLock

The files `SchM_Spi.h` and `SchM_Spi.c` are provided in the MCAL package as an example code and needs to be updated by the integrator. The user must implement the SchM functions defined by the SPI driver as

## 1 Spi driver

**suspend / resume** of interrupts for the CPU on which the API is invoked. A sample implementation of the SchM functions is shown as follows.

```

/**** Sample implementation of SchM_Spi.c ****/

void SchM_Enter_Spi_Queue_Update(void)
{
    /* Start of Critical Section */
    SuspendAllInterrupts(); /* Suspend CPU core interrupt */
}

void SchM_Exit_Spi_Queue_Update(void)
{
    /* End of Critical Section */
    ResumeAllInterrupts(); /* Resume CPU core interrupt */
}

void SchM_Enter_Spi_SyncLock(void)
{
    /* Start of Critical Section */
    SuspendAllInterrupts(); /* Suspend CPU core interrupt */
}

void SchM_Exit_Spi_SyncLock(void)
{
    /* End of Critical Section */
    ResumeAllInterrupts(); /* Resume CPU core interrupt */
}

```

- **Safety error:**

The SPI driver reports all the detected safety errors through the `Mcal_ReportSafetyError()` API.

The driver performs only detection and reporting of the safety errors. The handling of the reported errors shall be done by the user. The `Mcal_ReportSafetyError()` API is provided in the files `Mcal_SafetyError.c` and `Mcal_SafetyError.h` as a stub code, and must be updated by the integrator to handle the reported errors.

*Note: All DET errors are also reported as safety errors (error code used is same as DET).*

- **Notifications and callbacks:**

The SPI driver implements notification functions `Spi_JobEndNotification` and `Spi_SeqEndNotification` for job and sequence completion respectively. These notification functions can be configured by the user in the EB tresos tool for each job and sequence separately.

In Asynchronous communication, user should configure `Spi_QspiDmaCallout` function as the DMA call-back for RX channel in the respective DMA channel configuration. The configured call-back function `Spi_QspiDmaCallout` is triggered by DMA driver after completion of each channel transmission for updating BACON and start the transfer for successive channel.

*Note: Job and Sequence end notifications are only available for asynchronous communication.*

- **Operating system(OS)**

The OS or the application must ensure correct type of service and interrupt priority is configured in the SR register. Enabling and disabling of interrupts must also be managed by the OS or application.

The OS files provided by the MCAL package are only an example code and must be updated by the integrator with the actual OS files for the desired function.

## 1 Spi driver

### 1.1.4.2 Multicore and Resource Manager

The SPI driver supports execution of its APIs simultaneously from all CPU cores. The user should allocate resources of the SPI to the CPU cores at pre-compile time using the Resource Manager module. The following are the key points to be considered with respect to multicore in the driver:

- A kernel can be assigned to only one core and cannot be shared between cores. Multiple kernels can be assigned to a core.
- Channels can be re-used within cores, however, protection of data must be taken care by the application code.
- Application must ensure that the channel, job and sequence numbers passed to API belong to same core, else respective DET is triggered from the driver.
- Interrupts raised by the hardware must be serviced by the CPU core to which the kernel is allocated to.
- Locating of constants, variables and configuration data to the correct memory space should be done by the user. Memory sections are marked GLOBAL (common to all cores) and CORE[x](specific to a CPU core). The following should be considered by the user to ensure better performance of the driver:

#### **Code section:**

The executable code of the SPI driver is placed under single MemMap section. It can be relocated to any PFlash region.

#### **Data section:**

The RAM variable memory sections marked as specific to a core should be re-located to the DSPR/DLMU of the same core. The sections marked as global should be relocated to the non-cached LMU region.

#### **Configuration data and constants:**

The configuration data sections marked as specific to a core should be re-located to the PFlash of the same core. The sections marked as global should be relocated to the PFlash of the master core.

*Note 1: Relocating of code, data or constants to a distant memory region would impact execution timings.*

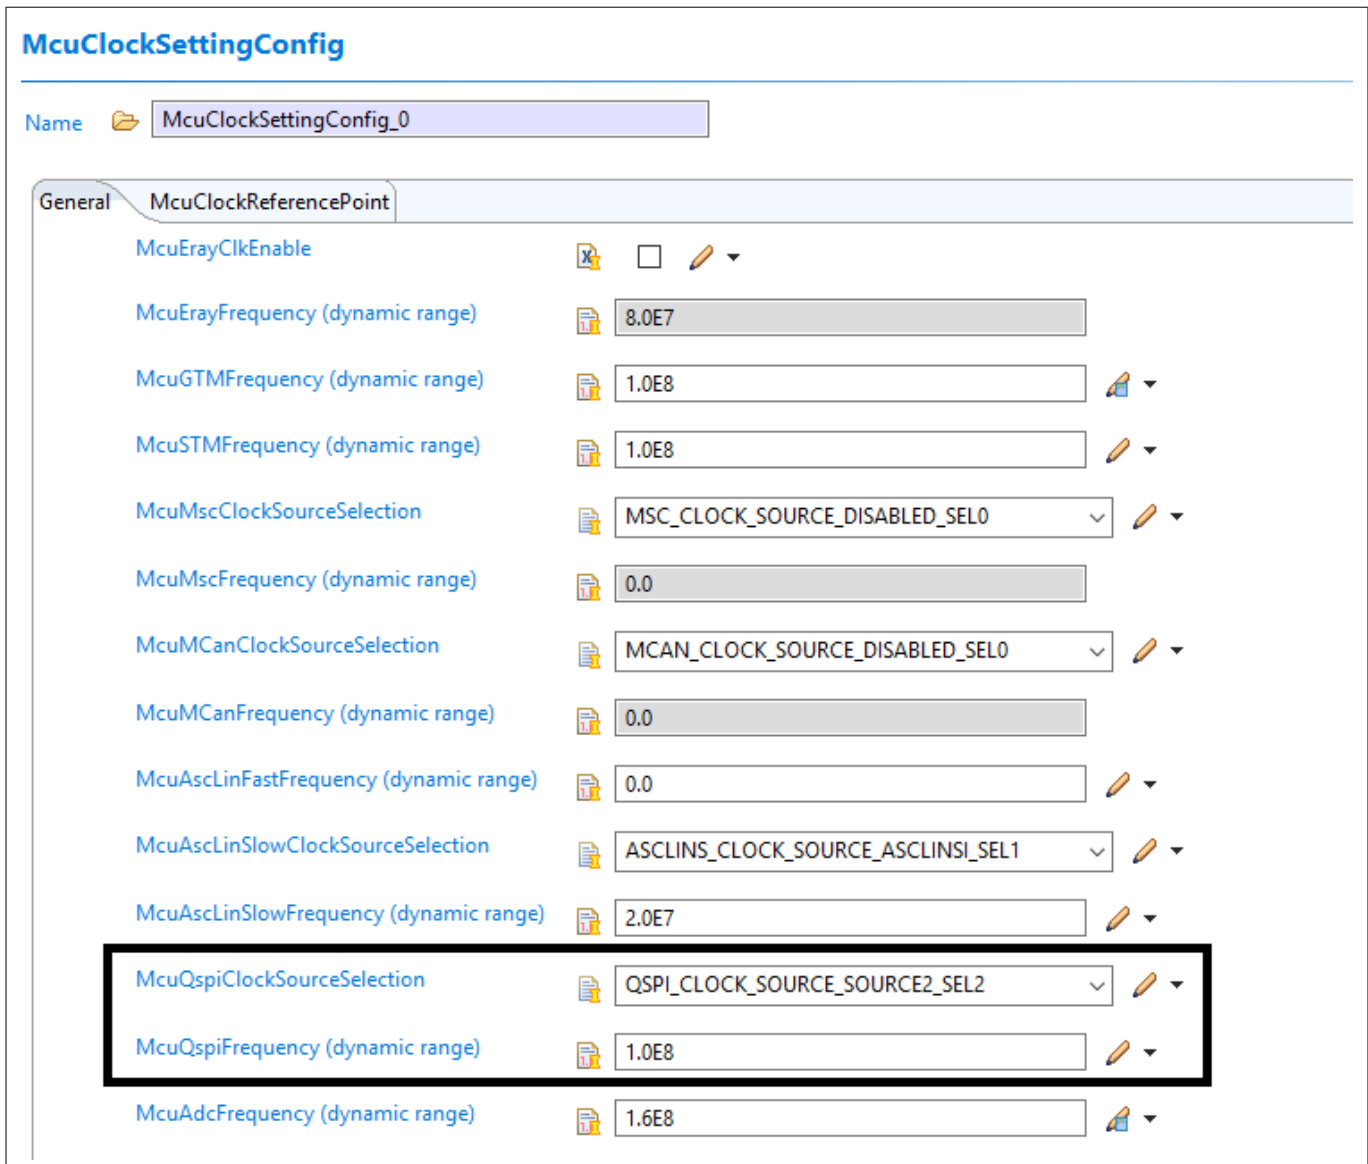

*Note 2: If the driver operates from single (master) core, all the sections may be relocated to the PFlash/DSPR/DLMU of the same CPU core.*

### 1.1.4.3 MCU support

The SPI driver is dependent on the MCU driver for clock configuration. The initialization of the SPI driver must be started only after completing the MCU initialization. Configuration parameters `McuQspiClockSourceSelection` and `McuQspiFrequency` need to be considered while for QSPI driver in EB tresos.

**Figure 4** QSPI clock / Frequency selection

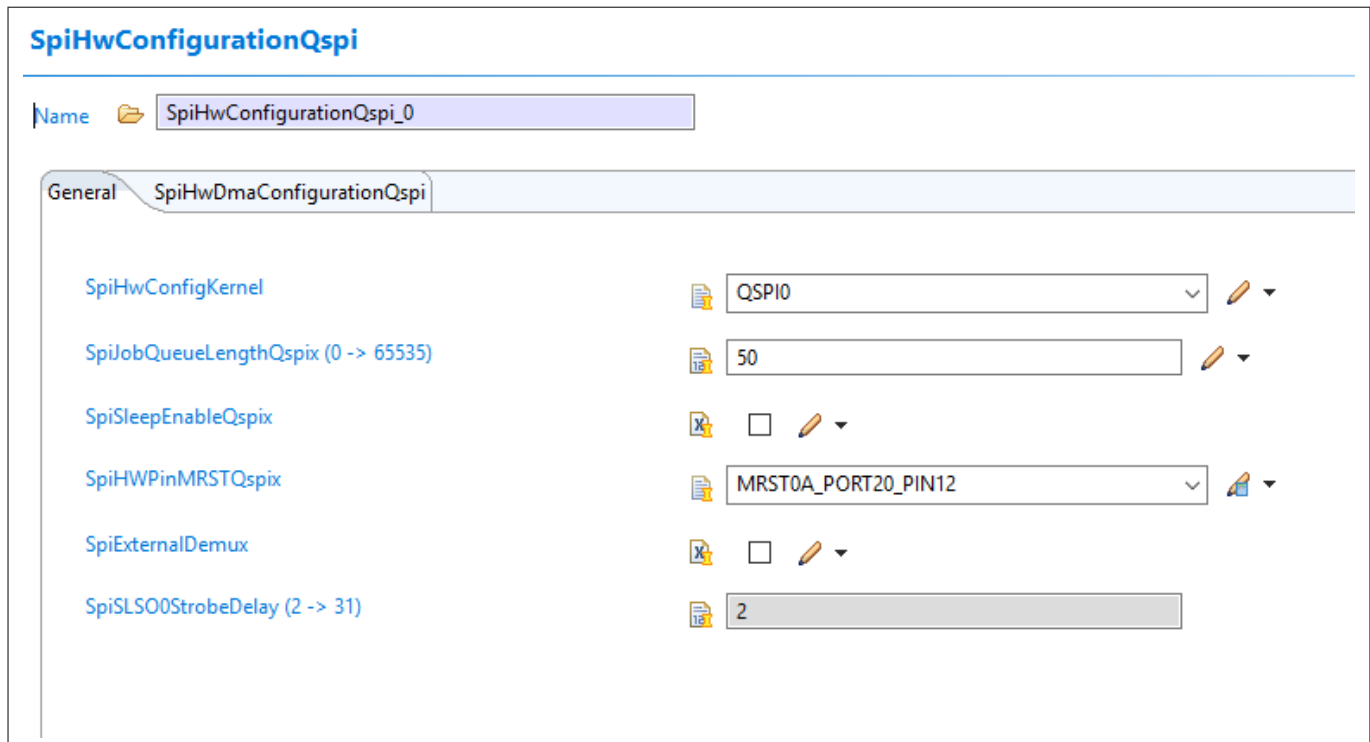

### 1.1.4.4 Port support

The PORT driver configures the port pins of the entire microcontroller. The user must configure port pins used by the SPI driver through the PORT configuration and initialize the port pins prior to invoking the SPI initialization.

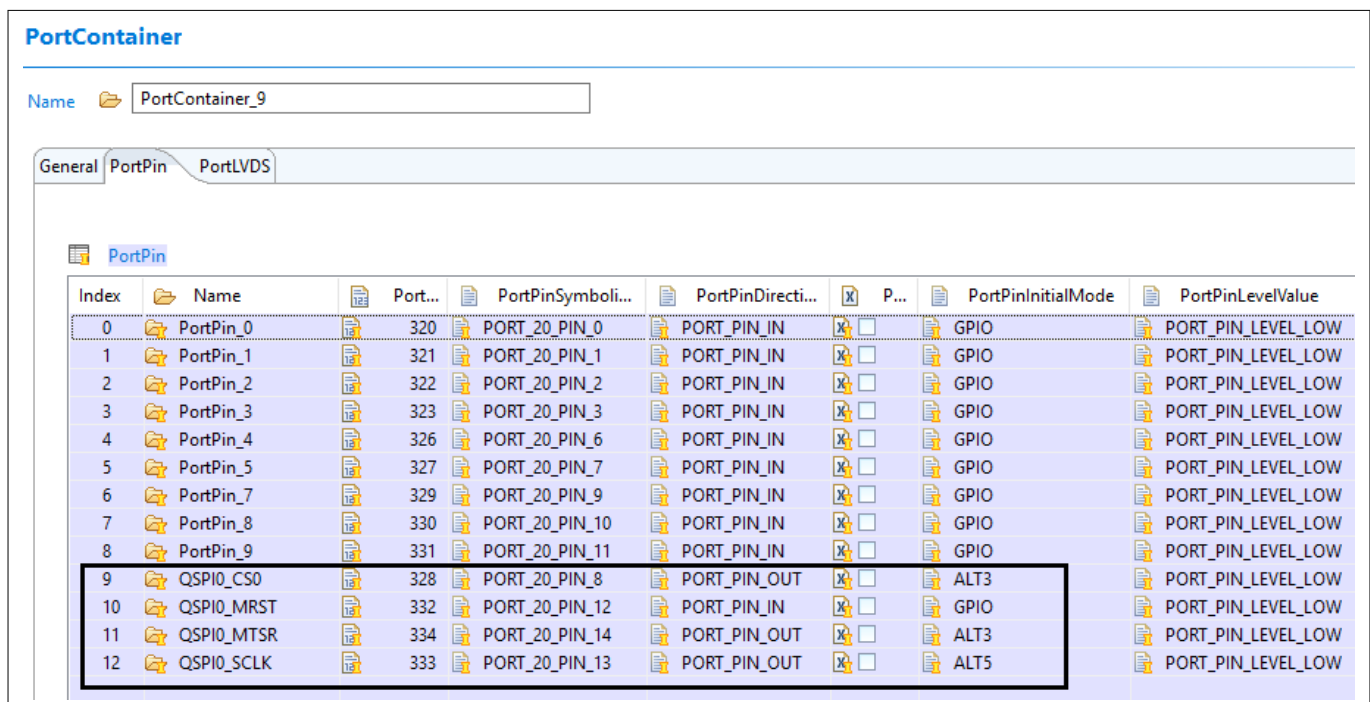

- MRST - master receive slave transmit
- MTSR - master Transmit slave receive
- CLOCK - clock pin
- SLSO - hardware driven chip select OR GPIO to be operated as chip select

An example configuration for QSPI-0 is shown in the following diagram. Note that the MRST should be configured in SPI driver configuration.

## 1 Spi driver

**Figure 5 QSPI MRST Configuration**

**Figure 6 Configure MTSR, SLSO, SCLK**

### 1.1.4.5 DMA support

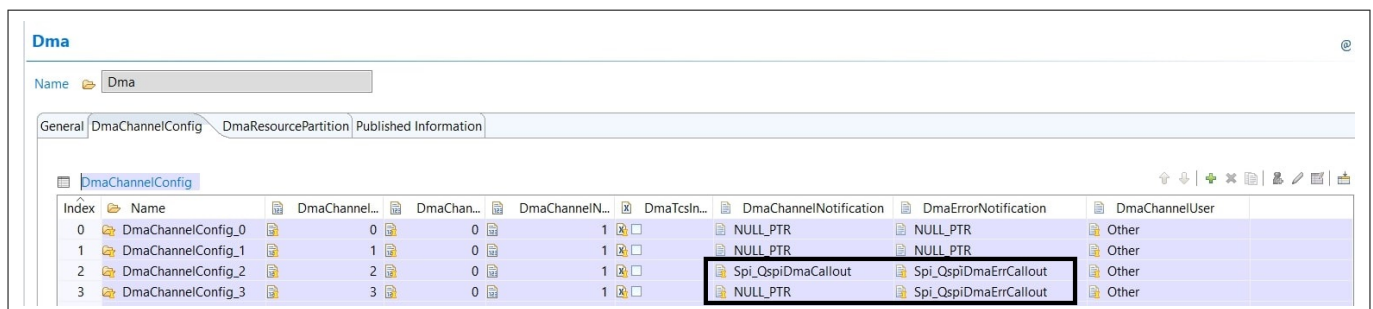

DMA channels should be configured when the QSPI is operated in the Level-1 or Level-2 asynchronous mode. QSPI uses two DMA channels one for RX and another for TX of QSPI. These DMA channels must be reserved for the QSPI communication only and cannot be reused.

### 1 Spi driver

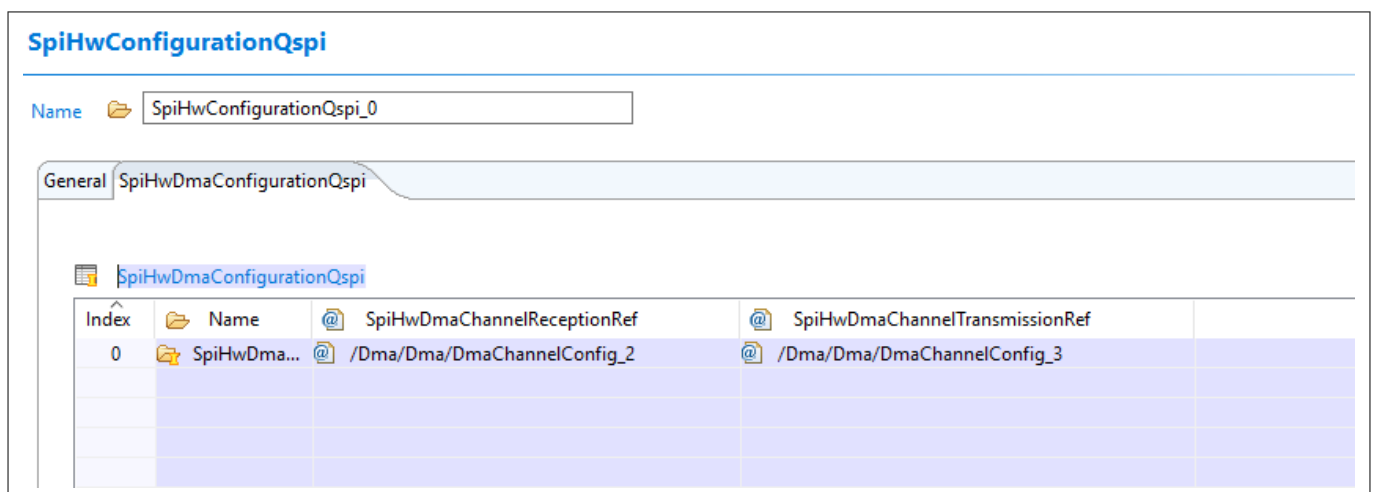

In the DMA, in the General configuration section, enable `DmaTriggerApi` as minimum configuration. Enable other configuration items as required by application. No other configurations are required in DMA. Transaction control set configurations for DMA are handled in SPI module and does not need any configuration in DMA module.

*Note: Add the respective DMA channel and configure the notification for the DMA Receive channel and error callout as shown in the image below.*

For internal buffers (`Spi_TxIBufferCorex`, `Spi_RxIBufferCorex`) and External buffers, Address space 0xD and 0xC shall not be used for DMA related usage. MemMap sections allocating memory in scratch pad RAM should always generate global addresses instead of local addresses.

**Figure 9 Configure Error and channel interrupts for DMA**

### ESM - DMA Error handling and Supervision:

The following are the safety measures for the user, for the handling of DMA error during asynchronous transmission:

If DMA channel used by the SPI driver encounters an error, then the DMA driver notifies the error along with the channel information to the SPI driver.

Following steps are recommended as part of Production error Handling:

1. Reset the channel using `Dma_ChStopTransfer` API
2. Reinitialize the channel using `Dma_ChInit` API

*Note1: The channel would have reinitialized to the initialization values which were provided during configuration.*

*Note2: If there are multiple DMA errors on the same resource partition, then due to the HW limitation only the last reported error will be processed by DMA and the intermediate errors will be lost.*

#### 1.1.4.6 Interrupt connections

The interrupt connections of the SPI driver are described in this section.

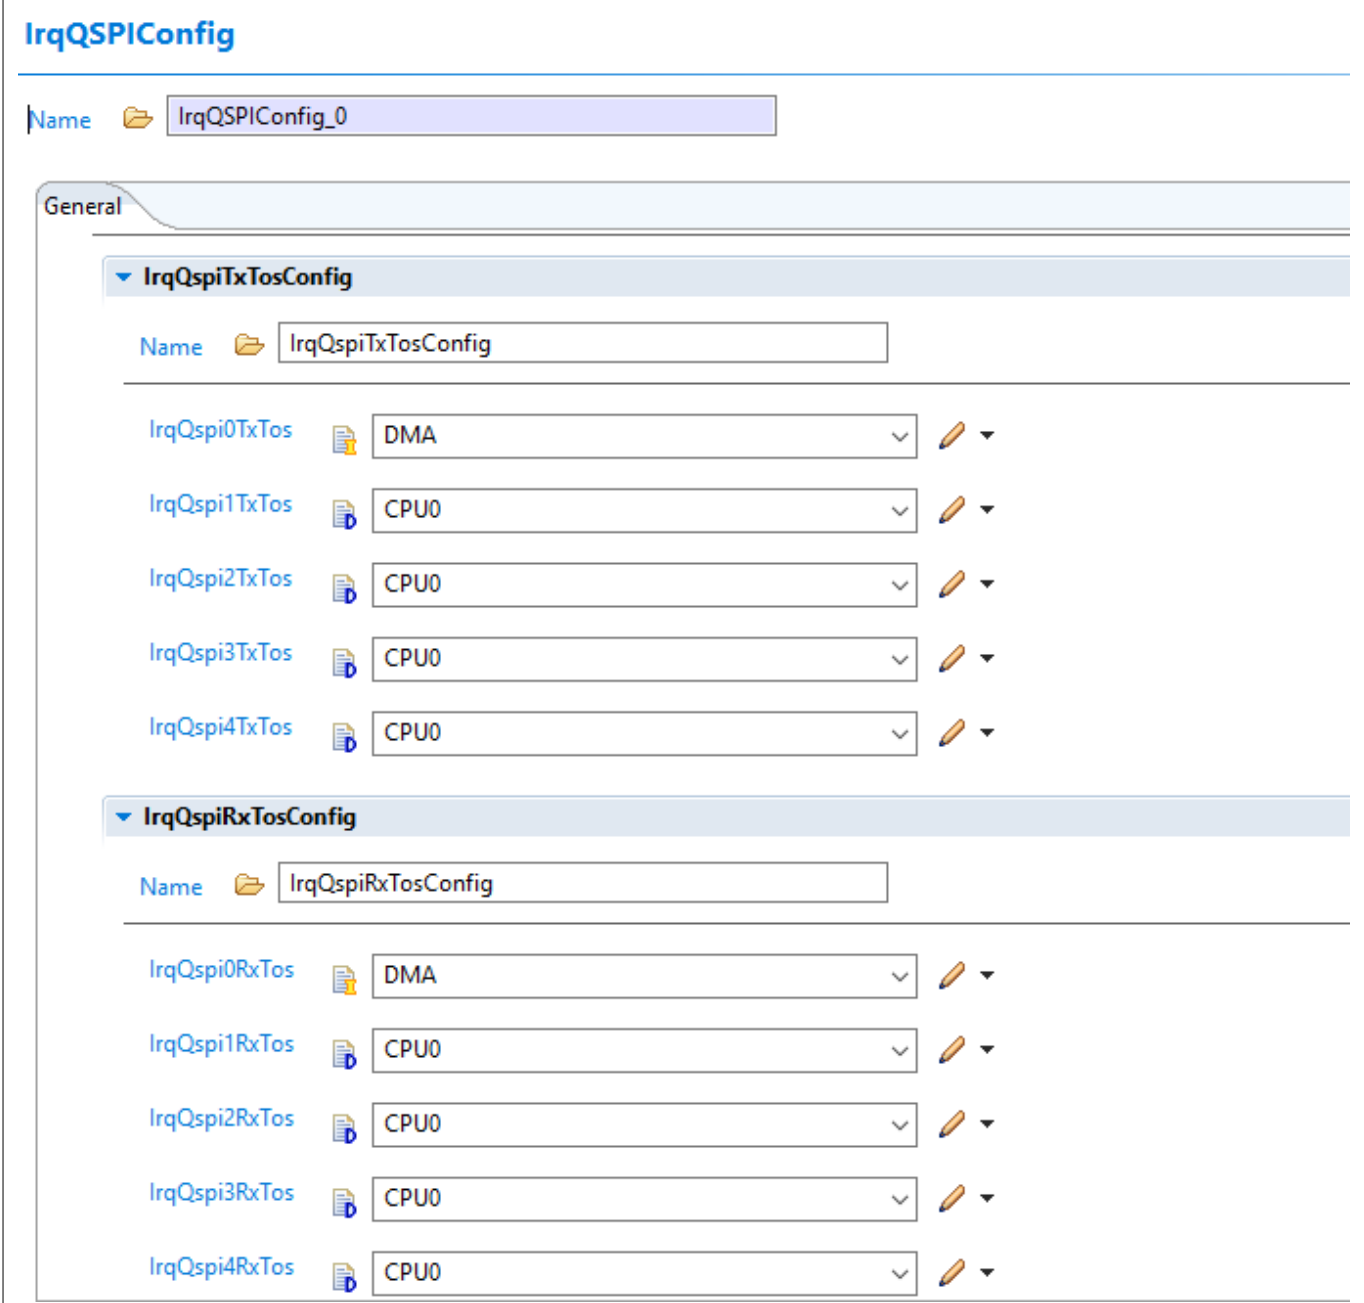

QSPI TX and RX interrupt triggers the DMA channel. The DMA triggers a callout at the end of channel transmission and BACON is updated for next successive channel transmission. PT2 interrupt indicates job frame complete. It is triggered at the end of frame transmission.

*Note 1: QSPI TX and RX interrupt priority - respective DMA channel numbers are to be allocated as shown in the sample.*

## 1 Spi driver

Note 2: Priority number order must be as follows DMA error > QSPI error > IRQ DMA-Ch TX > IRQ DMA-Ch RX > QSPI PT2. All the above interrupts are configured for asynchronous communication only.

Configure the QSPI and DMA priority numbers as shown in the images below.

## 1 Spi driver

A sample interrupt handler for QSPI0 kernel is depicted in the following code snippet:

```
/* Module header file inclusion */
#include "Spi.h"

ISR(QSPI0ERR_ISR)
{
    /* Call QSPI0 Error Interrupt handler */
    Spi_IsrQspiError(SPI_QSPI0_INDEX);
}

ISR(QSPI0PT_ISR)
{
    /* Call QSPI0 PT2 interrupt handler for frame completion */
    Spi_IsrQspiPT2(SPI_QSPI0_INDEX);
}
```

A sample invocation of interrupts for DMA is depicted as follows (applicable for Level-1 and Level-2)

```
ISR(DMAERR0SR_ISR)
{
    /* Handle error through respective DMA ME */
    Dma_MEInterruptDispatcher();
}

ISR(DMACH0SR_ISR)
{
    /* DMA RX interrupt handler, SPI callback will be called through this interrupt */
    Dma_ChInterruptHandler(0U);
}
```

*Note: The following API calls are allowed to use within the SPI callback notifications*

- *Spi\_ReadIB*
- *Spi\_WriteIB*
- *Spi\_SetupEB*
- *Spi\_GetJobResult*
- *Spi\_GetSequenceResult*
- *Spi\_GetHWUnitStatus*
- *Spi\_Cancel*

*All other SPI handler/driver APIs must not be called.*

## 1 Spi driver

### 1.1.4.7 Example usage

The following are some of the key use cases of the SPI driver.

*Note 1: Refer to the comments in the code snippets for additional information.*

*Note 2: Refer to integration hints of SPI driver and add all the dependent modules.*

*Note 3: DMA and IRQ module configuration is applicable only for Level-1 and Level-2. IRQ driver is not a productive module and code provided is only a sample code.*

#### Initialization of the SPI driver

The sample code sequence for initializing the SPI driver is as follows:

```
#include "Mcu.h"
#include "Spi.h"
#include "Port.h"
#include "Irq.h"
#if (SPI_LEVEL_DELIVERED != 0)
#include "Dma.h"
#endif

int core0_main (void)
{
    /* Initialize all dependent modules */
    /* MCU Initialization */
    Mcu_Init(&Mcu_Config);
    Mcu_InitClock(0U);
    while(Mcu_GetPllStatus() != MCU_PLL_LOCKED);
    Mcu_DistributePllClock();

    /* Port Initialization */
    Port_Init(&Port_Config);

    #if (SPI_LEVEL_DELIVERED != 0)
        /* Initialize IRQ module */
        IrqDma_Init();
        IrqSpi_Init();
        /* DMA initialization */
        Dma_Init(&Dma_Config);

        /* Enable service request for all the configured interrupts */
        SRC_DMACH2.U |= 0x400U;
        SRC_DMACH3.U |= 0x400U;
        SRC_QSPI0RX.U |= 0x400;
        SRC_QSPI0ERR.U |= 0x400;
        SRC_QSPI0TX.U |= 0x400;
        SRC_QSPI0PT.U |= 0x400;
    #endif

    /* Initialize SPI module */
    Spi_Init(&Spi_Config);
}
```

### Sample code snippets

#### Setting up internal buffer for IB channels - synchronous transmission

## 1 Spi driver

The steps for setting up the IB are as follows:

1. Configure the source buffer to be transmitted via the API Spi\_WriteIB.
2. After the buffers are setup for IB channel, transmit API should be invoked.
3. After transmission is completed, the received data should be read back from the internal buffer via the API Spi\_ReadIB

```

/* Align data buffers to 4 byte boundary */
#define SPI_START_SEC_VAR_INIT_ASIL_B_CORE0_32
#include "Spi_MemMap.h"

/* Source buffers */
Spi_DataBufferType Spi_SrcBuf0[BUFFER_LENGTH] = {
    0x11111111,
    0x22222222,
    0xAAAAAAA,
    0x55555555};

Spi_DataBufferType Spi_SrcBuf1[BUFFER_LENGTH] = {
    0x22222222,
    0x11111111,
    0x77777777,
    0xAAAAAAA};

#define SPI_STOP_SEC_VAR_INIT_ASIL_B_CORE0_32
#include "Spi_MemMap.h"

/* Align data buffers to 4 byte boundary */
#define SPI_START_SEC_VAR_CLEARED_ASIL_B_CORE0_32

Spi_ReadIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_1,Spi_DestBuf1);
```

### Polling transmission for asynchronous transmission

```
/* In Level-2, set the asynchronous transmission mode to interrupt (1) / polling (0) */  
Spi_SetAsyncMode((Spi_AsyncModeType)0U);  
  
/* Write data to IB buffer */  
Spi_WriteIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_0,Spi_SrcBuf0);  
Spi_WriteIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_1,Spi_SrcBuf1);  
  
/* start data transmission */  
u8returnvalue = Spi_AsyncTransmit(SpiConf_SpiSequence_SpiSequence_0);  
  
/* poll till the transmission completes */  
while(Spi_GetStatus() == SPI_BUSY)  
{  
    Spi_MainFunction_Handling();  
}  
  
/* Read data from IB buffer */  
Spi_ReadIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_0,Spi_DestBuf0);  
Spi_ReadIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_1,Spi_DestBuf1);
```

### SyncTransmit API trigerring queued jobs:

*Note : This is applicable only in Autosar version 4.4.0*

1. SyncTransmit API is called with a sequence.

## 1 Spi driver

2. During ongoing Spi\_SyncTransmit, a request for Spi\_AsyncTransmit for another sequence is accepted and queued for same QSPI hardware. These jobs will be triggered for transmission once the synchronous transmission is completed.

```

/* Align data buffers to 4 byte boundary */

Spi_ReadIB((Spi_ChannelType)SpiConf_SpiChannel_SpiChannel_3,Spi_DestBuf3);

```

### Number and position of interrupts for a sample Spi sequence configuration

Number and position of Spi interrupts		
Example configuration Of Spi Sequence	Spi_AsyncTransmit	
	Interrupt	Polling
Number of Jobs = 2 Number of Channels = 3 FramebasedCs = FALSE	<u>Number of interrupts:</u> 1 DMA Rx transfer complete interrupt / channel, hence 3 interrupts for 3 channels.  1 PT2 interrupt / job, hence 2 interrupts for 2 jobs.  1 DMA TRL interrupt / channel, hence 3 interrupts for 3 channels.  Total number of interrupts = 8.	<u>Number of interrupts:</u> QSPI Tx and Rx interrupts must be still configured to trigger DMA channels – but they do not interrupt CPU. Hence we do not count them here.  However the DMA TRL interrupt still occurs.  1 DMA TRL interrupt / channel, hence 3 interrupts for 3 channels.  Total number of interrupts = 3.
	<u>Position/event of interrupts relative to SPI transmission on bus:</u> DMA Rx interrupt at the end of each channel transmission.  DMA TRL interrupt at the end of each channel transmission.  PT2 interrupt at the end of each job ( i.e. last channel transmission in job )	<u>Position/event of interrupts relative to SPI transmission on bus:</u> DMA TRL interrupt at the end of each channel transmission.

**Figure 21**      **Number and position of Spi interrupts**

*Note 1: When `DmaTcsInterruptTransactionLoss` is enabled in DMA, TRL events are passed to SPI driver. If this field is disabled, TRL event is suppressed at the DMA driver.*

*Note 2: The TRL interrupt should be configured to be ignored in the DMA channel configuration.*

*Note 3: If `FramebasedCs` = TRUE, then PT2 interrupt is not used and the transition to next job happens in the `Spi_QspiDmaCaLLout()` API.*

*Note 4: In case of errors during asynchronous transmission, either QSPI or DMA error interrupt will be triggered.*

## 1 Spi driver

### 1.1.5 Key architectural considerations

#### 1.1.5.1 Transmission modes supported

The following transmission modes are supported:

- **Level 0:** Supports only synchronous transmission

In this mode, data to be transmitted is directly copied to TX FIFO. Data is transmitted in the order defined in the configuration. Note that this functionality is a blocking call, that is, until the transmission completes or error occurs, the API will not return the status.

- **Level 1:** Supports only asynchronous transmission

In this mode, the respective interrupts are configured and DMA is configured in Linklist mode for data transfer. The following interrupts are configured in Level 1 mode: TXF, RXF, PT2 and Error. The DMA driver invokes the callback function registered by the QSPI module on completion of channel transmission. Note that all the jobs of sequences that can be interrupted will be placed in priority order if interruptible sequence feature is enabled. Note that for asynchronous transmission each kernel is allocated with an independent queue to handle jobs as per priority.

- **Level 2:** Supports both synchronous and asynchronous transmission

Asynchronous transmission is further supported with either of Interrupt and polling mode. In the polling mode, DMA is still used for TX and RX transfers in interrupt mode, however the RX complete event is polled to check if channel transmission is complete to trigger the start of next channel transmission. Error and PT2 flags are polled to indicate if the frame is complete. Interrupt mode in Level 2 is same as Level 1 implementation. Note that In level-2 mode either synchronous or asynchronous sequences can be configured for transmission.

#### 1.1.5.2 General configuration

##### Decision on configuration of hardware

##### FIFO configuration

- TXFIFO / RXFIFO are configured for the Single move mode
- Move counter mode enabled with contentious move mode for transmission of data

##### Asynchronous communication (L1 and L2 mode)

By using the Move counter, SLSO de-assertion is handled by the hardware when the MCCOUNT reaches to "0". The following interrupts/callbacks are configured for QSPI for Asynchronous mode:

- TXF - Handled by DMA - Transmit FIFO interrupt - Request for feeding FIFO
- RXF - Handled by DMA - Receive FIFO interrupt - Request for emptying the FIFO
- ERROR - Handled by CPU - On QSPI Hardware error
- DMA Callback - Handled by CPU - Occurs on completion of channel data transmission
- DMA Error Callback - Handled by CPU - On DMA transfer errors (Move engine errors).
- PT2 interrupt - Handled by CPU - Occurs on complete transmission of job. Note that PT2 interrupt is needed to know the end of frame and counter can be loaded only when the IP is in the IDLE state

##### DMA usage / configuration

- Do note that two dedicated DMA channels should be assigned /QSPI each for TX and RX
- DMA is configured for asynchronous communication only and is configured to one DMA move (that is, one DMA transfer has one DMA move). DMA is configured to work in DMA linklist mode and two list are maintained for transmission and reception accordingly
- TCS memory for DMA linklist is allocated in the QSPI module and shall be passed to DMA by configuring suitably based on channel configuration by SPI module

## 1 Spi driver

- Any errors during the DMA transfer from move engine will be handled by the DMA module and should callback the error handler in the respective core to which kernel is assigned
- In order to achieve asynchronous communication priority Queue is implemented which is applicable for asynchronous communication only. Note that the jobs in Queue are maintained in priority order and each kernel is assigned with a Queue to maintain job id and its properties

### **Synchronous communication (L0 mode)**

- TX FIFO is directly fed with data without using the DMA.
- In Synchronous communication, transfer of data is done in blocking call, and the transmit function waits for data to be received or till the timeout occurs.
- No Queuing mechanism used for synchronous communication.

### **1.1.5.3 Multicore decision**

TC3xx is designed to have maximum six instances of QSPI and this varies based on the device variant. Each instance is defined to be a kernel and same is used through the document to represent single instance of QSPI IP. A kernel can be assigned to one of the cores and cannot be shared between cores. Multiple kernels can be assigned to a core.

All cores will work independent of each other, so configuration of master core is not applicable for this driver. However, if kernel is configured and not assigned to any core then configuration would be generated for master core. `Spi_Init` and `Spi_Deinit` can be called by any core and same will not affect the operation on other cores except for the one being called.

All APIs will be able to access the information configured for the local core only. For example, `Spi_GetJobResult` and `Spi_GetSequenceResult` APIs can return status for the jobs and sequence assigned to same core only, APIs cannot return results for the sequence assigned to different cores respective DETs will be raised if cross-core information is requested.

The `Spi_GetStatus` API will return the status local core. For example, if two kernels are assigned to core 1, if communication is in progress for core 2, and if `Spi_GetStatus` is called on core 1, IDLE will be returned if no communication on core 1. If the `Spi_GetStatus` is called on core 2, BUSY will be returned.

### **1.1.5.4 Sequence, jobs and channels**

Jobs cannot be shared between different sequences across different kernels within a sequence all the jobs should belong to the same hardware kernel.

Channels can be shared between two jobs within the same core. However protecting the content of the channel is the responsibility of the application code.

Maximum of 8190 elements can be transmitted for a job. This is the limitation of the counter that has been used by QSPI. However this limitation does not apply for Frame-based CS logic. For frame based CS, maximum elements of 16383 elements can be transmitted in a channel. For synchronous transfer, maximum of 65534 elements can be transmitted.

### **1.1.5.5 Lookup tables**

Lookup tables are added to expedite the access in configuration structures. Lookup tables are added for Sequence Ids, Job ids and Channel ids. Ids map the physical index to application Ids (Index in Lookup) in core configuration.

In the multicore environment since the configuration is spread across cores, accessing specific information for sequence, job and channel is time consuming since the applications ids are different from the physical location in core configuration. These tables are generated during code generation and these tables are placed in a core Flash accessible by all the cores.

---

**1 Spi driver****1.1.5.6 Interruptible sequence behavior****When SPI\_INTERRUPTIBLE\_SEQ\_ALLOWED is ON**

- If the incoming sequence is interruptible, the Individual jobs of a sequence are arranged in queue as per the priority of the job.

*Note: The order of placing the jobs in queue cannot guarantee that all the jobs of a sequence are placed in consecutive locations.*

- If the incoming sequence is non-interruptible, Instead of individual jobs, the entire sequence is placed in queue as per the priority of the first job in sequence.

*Note: The order of placing the jobs in queue guarantees that all the jobs of a sequence are placed in consecutive locations.*

**When SPI\_INTERRUPTIBLE\_SEQ\_ALLOWED is OFF**

All the incoming sequences are considered as non-interruptible and entire sequence is placed in queue as per the priority of first job in sequence.

*Note: The order of placing the jobs in queue guarantees that all the jobs of a sequence are placed in consecutive locations.*

**1.1.5.7 External demultiplexer feature**

If a QSPI is configured to operate in external demultiplexer mode, the SLSO1 to SLSO4 are driven with the value configured for configuration parameter `SpiCsIdentifier` of external device. To ensure glitch free selection, a strobe signal SLSO0 is provided and the value of the strobe delay is configured using configuration parameters `SpiSLSO0StrobeDelay`. The polarity for all these SLSO lines(SLSO0..SLSO4) are configured with the same value given for configuration parameter `SpiCsPolarity` of external device.

At any given point of time, a QSPI can be operated either in external demultiplexer mode or normal mode.

## 1 Spi driver

### 1.2 Assumptions of Use (AoU)

The AoU for the SPI driver are as follows.

- **SPI API Sequence**

Integrator shall make sure the following sequence of APIs are followed before calling the Spi\_Init API:

L0 Mode:

1. Mcu\_Init(&Mcu\_Config)
2. Mcu\_InitClock(0U)
3. Mcu\_DistributePllClock()
4. Port\_Init(&Port\_Config)
5. Spi\_Init(&Spi\_Config)

L1, L2 mode:

1. Mcu\_Init(&Mcu\_Config)
2. Mcu\_InitClock(0U)
3. Mcu\_DistributePllClock()
4. IrqDma\_Init()
5. IrqSpi\_Init()
6. Dma\_Init(&Dma\_Config)
7. Port\_Init(&Port\_Config)
8. Spi\_Init(&Spi\_Config)

[cover parentID SPI={7C102304-D585-410a-9D19-2A54F6076E91}]

- **Spi\_InitCheck**

Integrator shall make sure that all APIs of the SPI driver except for Spi\_init, Spi\_GetversionInfo API shall be called only after successful execution of the Spi\_InitCheck API. SFRs related to other modules getting modified cannot be verified. This should be checked by dependent modules InitCheck APIs.

Rationale: InitCheck API shall ensure all the pointers used for cores and kernels are properly initialized and state of driver is in known state before calling any API.

[cover parentID SPI={6073DDFE-0B7F-43e9-95C4-197677F5BC53}]

- **Global configuration pointer**

Global configuration pointer passed for the Spi\_Init API should be same across all the cores.

Rationale: If other pointer is passed configuration is corrupted and behaviour is unpredictable.

[cover parentID SPI={4603B79C-742E-464e-9824-B8C498554055}]

- **SchM implementation**

All Schm\_x function calls are non-productive functions and are to be implemented from the application developer. Core-related interrupts are expected to be disabled between the entry and exit of the Schm calls.

Following listed Schm functions are implemented in the SPI module:

- SchM\_Enter\_Spi\_Queue\_Update() / SchM\_Exit\_Spi\_Queue\_Update()
- SchM\_Enter\_Spi\_SyncLock() / SchM\_Exit\_Spi\_SyncLock()

Rationale: Schm calls are made to protect the global variables shared across interrupt / different API context.

[cover parentID SPI={C087EEC6-8339-403c-A251-FB28C8CB6F9B}]

- **DMA Rx notification**

---

**1 Spi driver**

The SPI is dependent on DMA to do transfer of data. The SPI driver does not perform interrupt source check, it is the responsibility of the dependent module like DMA shall perform the interrupt source check before calling the respective channel notification / handlers.

Rationale: Registers of dependent module are accessed only by module driver only.

[cover parentID SPI={84215E23-909B-46ae-A499-07FA622AE7FA}]

- **DMA resource allocation to SPI module**

The integrator shall ensure that two dedicated DMA channels are to be allocated for TX and RX of QSPI and these channels cannot be shared with any peripherals or changed dynamically.

Rationale: DMA channels cannot be shared once allocated to QSPI.

[cover parentID SPI={43520DE0-4A16-427b-84AF-13A616D8B977}]

- **Watchdog triggering**

The integration should make sure that watchdog is enabled and is triggered in case of no response or driver is stuck in a busy state.

Rationale : Due to hardware faults, interrupts may not get triggered and driver may be in BUSY state.

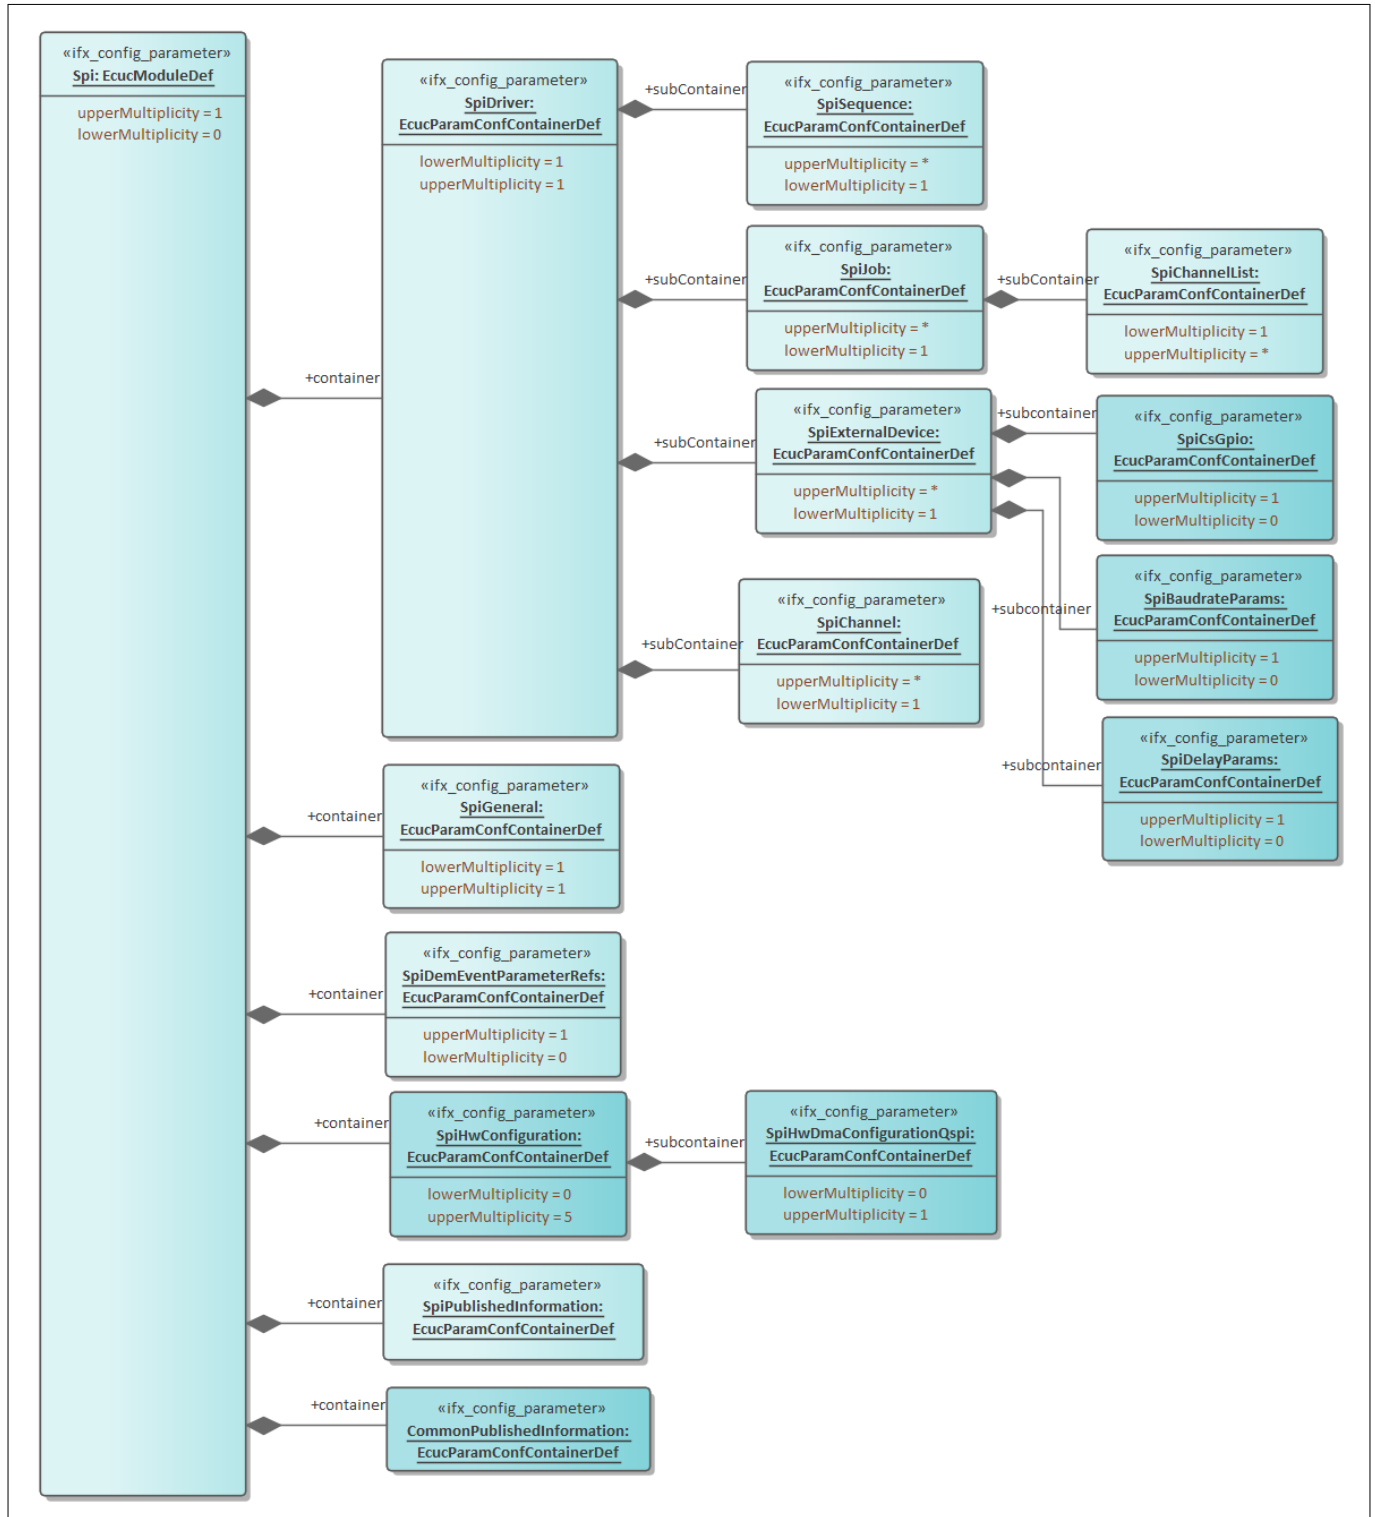

[cover parentID SPI={041495D5-3E7A-4708-8608-D817B5F51EC0}]

### 1.3.1.4 Container: SpiChannel

This container contains the configuration parameters to describe a channel.

Lower multiplicity is 1 and upper multiplicity is 255.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Post-Build

#### 1.3.1.4.1 SpiChannelId

**Table 18**      **Specification for SpiChannelId**

<b>Name</b>	SpiChannelId		
<b>Description</b>	<p>This is ID number assigned to SPI channel.</p> <p>By default SpiChannelId is set to 0, however this number is auto incremented on adding successive channels.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- Due to Multi-core implementation physical and logical channel ids are to be generated. Logical channel ids are numbered sequentially, however in the configuration, physical memory location can be different due to assignment of channels to jobs of different cores</li> <li>- Application should always use the same number generated as per the Spi_Cfg.h file for accessing channel buffers. ex: SpiConf_SpiChannel_(x). x is derived from the name provided by the user in the configuration</li> <li>- ID - 0xFF (255) value is used as delimiter to indicate the end of channel-id list</li> </ul>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 254		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.4.2 SpiChannelType

**Table 19**      **Specification for SpiChannelType**

<b>Name</b>	SpiChannelType
-------------	----------------

(table continues...)

**1 Spi driver**
**Table 19 (continued) Specification for SpiChannelType**

<b>Description</b>	This parameter specifies the buffer type (External Buffer / Internal Buffer) used by the channel.  IB - Channel of internal buffer type EB - Channel of external buffer type  By Default buffer type is set to EB since most applications prefer using EB over IB.  <i>Note: The value configuration class and postBuildVariantValue is deviated from AUTOSAR due to this parameter is used in generating a macro for total number of IB channels, EB channels and total IB buffer size configured for the core.</i>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	EB: External Buffer IB: Internal Buffer		
<b>Default value</b>	EB		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiChannelBuffersAllowed		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.4.3 SpiDataWidth**
**Table 20 Specification for SpiDataWidth**

<b>Name</b>	SpiDataWidth		
<b>Description</b>	This parameter specifies the width of the data to be transmitted in terms of bits.  <i>Note: The QSPI supports the datawidth from 2 to 32 bits. Deviated from AUTOSAR 4.4.0 and AUTOSAR 4.2.2</i>  Default value for SpiDataWidth is set to 8 since the frames provided by any application would be defined in bytes (8-bits).  <i>Note: The value configuration class and postBuildVariantValue is deviated from AUTOSAR due to this parameter is used in generating a macro for total number of IB channels, EB channels and total IB buffer size configured for the core.</i>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	2 - 32		
<b>Default value</b>	8		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

**(table continues...)**

## 1 Spi driver

### 1.3.1.4.7 SpiTransferStart

**Table 24 Specification for SpiTransferStart**

<b>Name</b>	SpiTransferStart		
<b>Description</b>	This parameter specifies whether, Least Significant Bit (LSB) is transmitted first or Most Significant bit (MSB) transmitted first.  By Default TransferStart is set to LSB, since most devices communicate over LSB frames.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	LSB: Transmission starts with the Least Significant Bit first MSB: Transmission starts with the Most Significant Bit first		
<b>Default value</b>	LSB		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.5 Container: SpiChannelList

References to SPI channels and their order within the Job.

Lower multiplicity is 1 and upper multiplicity is 255(Max supported channels)

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Post-Build

#### 1.3.1.5.1 SpiChannelAssignment

**Table 25 Specification for SpiChannelAssignment**

<b>Name</b>	SpiChannelAssignment		
<b>Description</b>	This parameter specifies the channel linked to this Job container.  <i>Note: The value configuration class and postBuildVariantValue is deviated from AUTOSAR due to this parameter is used in generating a macro for total number of IB channels, EB channels and total IB buffer size configured for the core.</i>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: SpiChannel		
<b>Default value</b>	None		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-

(table continues...)

## 1 Spi driver

**Table 25 (continued) Specification for SpiChannelAssignment**

<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.5.2 SpiChannelIndex

**Table 26 Specification for SpiChannelIndex**

<b>Name</b>	SpiChannelIndex		
<b>Description</b>	This parameter specifies the order of Channels within the Job. <i>Note: The value 255 is used as delimiter to indicate that all the channels assigned are completed.</i>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 254		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.6 Container: SpiCsGpio

This container specifies the port pin which is used for Chip Select assertion/De-assertion.

It is applicable if SpiCsSelection is CS\_VIA\_GPIO and has multiplicity of 0...1.

Post-Build Variant Multiplicity: TRUE

Multiplicity Configuration Class: Post-Build

#### 1.3.1.6.1 SpiCsGpioPinSelection

**Table 27 Specification for SpiCsGpioPinSelection**

<b>Name</b>	SpiCsGpioPinSelection
-------------	-----------------------

(table continues...)

## 1 Spi driver

**Table 27 (continued) Specification for SpiCsGpioPinSelection**

<b>Description</b>	<p>This parameter specifies the pin number of the port specified by SpiCsGpioPortSelection, used as Chip select, which is activated/de-activated by the SPI driver.</p> <p>Enabled only if SpiEnableCs is true and SpiCsSelection is CS_VIA_GPIO</p> <p><i>Note: The range of port pins would vary across variants, refer to respective DS to check for the exact number of port-pins. A port can contain maximum of 16 pins.</i></p> <p>By Default the port-pin and port is set to 1, this has to be modified by application as per the Hardware mapping.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 15		
<b>Default value</b>	1		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiCsSelection, SpiEnableCs		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.6.2 SpiCsGpioPortSelection

**Table 28 Specification for SpiCsGpioPortSelection**

<b>Name</b>	SpiCsGpioPortSelection		
<b>Description</b>	<p>This parameter specifies the port number whose one of the pin is used as Chip select, which is activated/de-activated by the SPI driver.</p> <p>Enabled only if SpiEnableCs is true and SpiCsSelection is CS_VIA_GPIO</p> <p><i>Note: The port number can vary from 0 to 41 depending on the device variant. Refer to respective DS to know the exact number of port available.</i></p> <p>By Default the port-pin and port is set to 1, this has to be modified by application as per the Hardware mapping.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 41		
<b>Default value</b>	1		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL

(table continues...)

## 1 Spi driver

**Table 28 (continued) Specification for SpiCsGpioPortSelection**

<b>Dependency</b>	SpiCsSelection, SpiEnableCs
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.

### 1.3.1.7 Container: SpiDelayParams

This container is Applicable only when the parameter SpiAutoCalcDelayParams is set to FALSE

Defines the basic configuration for the current slave select. The parameters are vendor specific for use by SPI Hardware. Default values for this container is set to obtain a minimum delay in nanoseconds.

*Note: The Multiplicity for the container is 0..1*

Post-Build Variant Multiplicity: TRUE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.7.1 SpiDelayParamIdleLength

**Table 29 Specification for SpiDelayParamIdleLength**

<b>Name</b>	SpiDelayParamIdleLength		
<b>Description</b>	Idle Delay Length Defines the length of both idle delays, IDLEA and IDLEB, in Tqspi units pre scaled with IPRE 0 represents 1 units 1 represents 2 unit ... 7 represents 8 units Applicable only when the parameter SpiAutoCalcDelayParams is set to false and CS is driven by HW engine. The default value is set to obtain a minimum delay in nanoseconds.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 7		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiAutoCalcDelayParams, SpiCsSelection		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1 Spi driver**
**1.3.1.7.2 SpiDelayParamIdlePre**
**Table 30 Specification for SpiDelayParamIdlePre**

<b>Name</b>	SpiDelayParamIdlePre		
<b>Description</b>	Pre-scalar for the Idle Delay Length in Tqspi units b000 represents 1 b001 represents 4 b010 represents 16 ... b111 represents 16384 Applicable only when the parameter SpiAutoCalcDelayParams is set to false and CS is driven by HW engine. The default value is set to obtain a minimum delay in nanoseconds.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 7		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiAutoCalcDelayParams, SpiCsSelection		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.7.3 SpiDelayParamLeadLength**
**Table 31 Specification for SpiDelayParamLeadLength**

<b>Name</b>	SpiDelayParamLeadLength		
<b>Description</b>	Leading Delay Length Defines the length of the leading delay, in Tqspi units pre scaled with LPRE 0 - 1 units 1 - 2 unit ... 7 - 8 units Applicable only when the parameter SpiAutoCalcDelayParams is set to false and CS is driven by HW engine. The default value is set to obtain a minimum delay in nanoseconds.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 7		
<b>Default value</b>	0		

(table continues...)

### 1.3.1.8 Container: SpiDemEventParameterRefs

Container lists the production errors supported by SPI driver. The standardized errors are provided in the container and can be extended by vendor specific error references. Multiplicity of the container is 0..1

*Note: The configuration of DEM is mandatory when SpiSafetyEnable is true.*

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.8.1 SPI\_E\_HARDWARE\_ERROR

**Table 35 Specification for SPI\_E\_HARDWARE\_ERROR**

<b>Name</b>	SPI_E_HARDWARE_ERROR		
<b>Description</b>	Reference to configured DEM event to report Hardware failure. If the reference is not configured the error will not be reported.		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucSymbolicNameReferenceDef
<b>Range</b>	Reference to Node:		
<b>Default value</b>	NULL		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiSafetyEnable		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.9 Container: SpiDriver

This container contains the configuration parameters and sub containers of the AUTOSAR Spi module.

Multiplicity is 1..1

Post-Build Variant Multiplicity: -

Multiplicity Configuration Class: -

## 1 Spi driver

### 1.3.1.9.1 SpiMaxChannel

**Table 36**      **Specification for SpiMaxChannel**

<b>Name</b>	SpiMaxChannel		
<b>Description</b>	<p>This parameter represents number of channels allocated to all the cores. It will be gathered by tools during the configuration stage and hence not editable.</p> <p>This parameter is visible in Tresos only if the field is added after adding all channels, however code is generated for application use.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- When there are no channels configured, the parameter is set with value 0 and however the code generation throws an error</li> <li>- Range for this parameter is deviated from AUTOSAR 4.4.0 and AUTOSAR 4.2.2</li> <li>- The postBuildVariantValue is set to FALSE because changing the value across the variants irrespective of number of channels configured has an impact on the total number of channels configured per core</li> </ul> <p>Rationale: Due to the limitation of Tresos tool, it is not possible to derive the maximum number of channels configured across the variants.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 255		
<b>Default value</b>	Depends on Max channels added		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	TRUE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.9.2 SpiMaxJob

**Table 37**      **Specification for SpiMaxJob**

<b>Name</b>	SpiMaxJob
-------------	-----------

(table continues...)

**1 Spi driver**
**Table 37 (continued) Specification for SpiMaxJob**

<b>Description</b>	<p>This parameter represents the total number of jobs allocated across cores. It will be gathered by tool during code generation stage and hence is not editable.</p> <p>This field is visible only if added after all jobs are added in system, however in code generation value is generated properly and available to application use.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- When there are no jobs configured, the parameter is set with value 0 and however the code generation throws an error</li> <li>- Range for this parameter is deviated from AUTOSAR 4.4.0 and AUTOSAR 4.2.2</li> <li>- The postBuildVariantValue is set to FALSE because changing the value across the variants irrespective of number of jobs configured has an impact on the total number of jobs configured per core</li> </ul> <p>Rationale: Due to the limitation of Tresos tool, it is not possible to derive the maximum number of jobs configured across the variants.</p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	1 - 5000		
<b>Default value</b>	Depends on total jobs added		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	TRUE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL

### 1.3.1.10.5 SpiCsPolarity

**Table 44 Specification for SpiCsPolarity**

<b>Name</b>	SpiCsPolarity		
<b>Description</b>	This parameter defines the active polarity of chip select. By Default SpiCsPolarity is set to LOW to support wide variety of devices.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	HIGH: LOW:		
<b>Default value</b>	LOW		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.6 SpiCsSelection

**Table 45 Specification for SpiCsSelection**

<b>Name</b>	SpiCsSelection		
<b>Description</b>	Indicates if the chip select is either through GPIO (Driven from the SPI driver) or SLSO (Driven by the QSPI Hardware). By Default SpiCsSelection is set to CS_VIA_PERIPHERAL_ENGINE so that using SLSO is the recommended mechanism to have better performance.		

(table continues...)

**1 Spi driver**
**Table 45 (continued) Specification for SpiCsSelection**

<b>Multiplicity</b>	0..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	CS_VIA_GPIO: Chip select handled via GPIO by SPI driver. CS_VIA_PERIPHERAL_ENGINE: Chip select is handled via Peripheral Hardware engine.		
<b>Default value</b>	CS_VIA_PERIPHERAL_ENGINE		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	TRUE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build

### 1.3.1.10.11 SpildleTime

**Table 50 Specification for SpildleTime**

<b>Name</b>	SpiIdleTime		
<b>Description</b>	<p>This parameter IDLEA/IDLEB time is the QSPI hardware delay after which SLSO will be activated by Hardware.</p> <p>The default value is chosen to support most of the baudrate configurations.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.00000004 - 0.098304		
<b>Default value</b>	0.0000001		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiAutoCalcDelayParams, SpiCsSelection		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.10.12 SpiParitySupport

**Table 51 Specification for SpiParitySupport**

<b>Name</b>	SpiParitySupport		
<b>Description</b>	<p>This parameter indicates whether the parity feature to be enabled in Hardware or not.</p> <p>Default value for this parameter is set to UNUSED to support wide varieties of external devices.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>EVEN: Parity Bit added during Transmission to make the data as Even Parity</p> <p>ODD: Parity Bit is added during Transmission to make the data as Odd Parity</p> <p>UNUSED: Parity not configured</p>		
<b>Default value</b>	UNUSED		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1 Spi driver**
**1.3.1.10.13 SpiShiftClockIdleLevel**
**Table 52 Specification for SpiShiftClockIdleLevel**

<b>Name</b>	SpiShiftClockIdleLevel		
<b>Description</b>	<p>This parameter defines the idle level of shift clock. The idle level of the shift clock can be configured to be idle level low or idle level high.</p> <p>By default SpiShiftClockIdlelevel is set to LOW to support wide range of application.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	<p>HIGH: Shift clock idle level is a high voltage level</p> <p>LOW: Shift Clock idle level is low</p>		
<b>Default value</b>	LOW		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.10.14 SpiTimeClk2Cs**
**Table 53 Specification for SpiTimeClk2Cs**

<b>Name</b>	SpiTimeClk2Cs		
<b>Description</b>	<p>This parameter is the minimum time (in seconds) between clock and chip select.</p> <p>This parameter is used to calculate the QSPI Hardware lead delay parameters LPRE and LEAD. The default value is chosen to support most of the baudrate configurations.</p> <p>Enabled only when the parameter SpiAutoCalcDelayParams is set to TRUE.</p> <p>Provide configuration error if the delay value is incorrect for the given frequency(Fqspi).</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- This value is set to default when the CS_VIA_GPIO is selected as the option since the timing cannot be guaranteed when GPIO is used as chip select</li> <li>- Range for this parameter is deviated from AUTOSAR 4.2.2 and AUTOSAR 4.4.0</li> </ul> <p>Min value of this parameter is derived through the capability of AURIX Hardware and derived based on the clock that can be supplied to peripheral, note that parameter values are deviated from AUTOSAR defined values.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucFloatParamDef
<b>Range</b>	0.00000004 - 0.0001		

**(table continues...)**

<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.13 Container: SpiHwDmaConfigurationQspi

Contains the references of DMA channels for QSPI Tx and Rx channels in configuration.

## 1 Spi driver

This parameter is IFX specific to make use of Hardware provided capability to configure the associated DMA channels for SPI.

Multiplicity is 0..1

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

### 1.3.1.13.1 SpiHwDmaChannelReceptionRef

**Table 81** Specification for SpiHwDmaChannelReceptionRef

<b>Name</b>	SpiHwDmaChannelReceptionRef		
<b>Description</b>	This parameter refers to the DmaConfiguration. Channel is a reference field available through configured list of channels in DMA module.  Available only if SpiLevelDelivered is 1 or 2.		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: SpiHwDmaConfigurationQspi		
<b>Default value</b>	None		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.13.2 SpiHwDmaChannelTransmissionRef

**Table 82** Specification for SpiHwDmaChannelTransmissionRef

<b>Name</b>	SpiHwDmaChannelTransmissionRef		
<b>Description</b>	This parameter refers to the DmaConfiguration. Channel is a reference field available through configured list of channels in DMA module.  Available only if SpiLevelDelivered is 1 or 2.		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: SpiHwDmaConfigurationQspi		
<b>Default value</b>	None		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	Pre-Compile

## 1 Spi driver

**Table 82 (continued) Specification for SpiHwDmaChannelTransmissionRef**

<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.14 Container: SpiJob

This container contains the configuration parameters to describe a job.

A Job must contain at least one Channel. If a Job contains more than one Channel, all Channels contained have the same Job properties during transmission and will be linked together statically.

Lower Multiplicity is 1 and upper multiplicity is 5000.

Post-Build Variant Multiplicity: FALSE

Multiplicity Configuration Class: Pre-Compile

#### 1.3.1.14.1 SpiDeviceAssignment

**Table 83 Specification for SpiDeviceAssignment**

<b>Name</b>	SpiDeviceAssignment		
<b>Description</b>	This parameter is a reference parameter to the external device container.  <i>Note: In AUTOSAR 4.2.2, if the same External Device assigned for both Synchronous and Asynchronous Jobs, a configuration error is reported during code generation.</i>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: SpiExternalDevice		
<b>Default value</b>	None		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

#### 1.3.1.14.2 SpiFrameBasedCS

**Table 84 Specification for SpiFrameBasedCS**

<b>Name</b>	SpiFrameBasedCS
-------------	-----------------

(table continues...)

**1 Spi driver**
**Table 84 (continued) Specification for SpiFrameBasedCS**

<b>Description</b>	<p>If Frame based CS feature is enabled, It asserts and de-asserts the SLSO for every data element being transferred through SPI interface.</p> <p>If Frame based CS feature is disabled, the assertion of SLSO happens at the start of job transmission and de-assertion of SLSO happens at the end of job transmission.</p> <p><i>Note: Frame based CS is allowed to enable only when SpiCsSelection = CS_VIA_PERIPHERAL_ENGINE.</i></p> <p>This parameter is IFX specific to make use of Hardware provided capability. By Default this feature is disabled since this is application specific and not frequently used.</p>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucBooleanParamDef
<b>Range</b>	TRUE FALSE		
<b>Default value</b>	FALSE		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	IFX	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.14.3 SpiHwUnitSynchronous**
**Table 85 Specification for SpiHwUnitSynchronous**

<b>Name</b>	SpiHwUnitSynchronous
-------------	----------------------

**(table continues...)**

**1 Spi driver**
**Table 85 (continued) Specification for SpiHwUnitSynchronous**

<b>Description</b>	<p>If SpiHwUnitSynchronous is set to SYNCHRONOUS, then the job is used in a synchronous manner and vice versa.</p> <p>Since AUTOSAR requirement says to pre-assigned SPI buses required for transmission, this parameter is created to pre-assign the available SPI bus to Sync or Async.</p> <p>This parameter is mandatory in Level-2 configuration where as it is optional in Level-0 and Level-1.</p> <ul style="list-style-type: none"> <li>- In case, if the configuration parameter is added in Level-0, then the value for the configuration parameter must be selected as Synchronous.</li> <li>- In case, if the configuration parameter is added in Level-1, then the value for the configuration parameter must be selected as Asynchronous.</li> </ul> <p>A configuration error is reported in case of inappropriate value.</p> <p>By default value is set to ASYNCHRONOUS since most application use the L2 configuration and use asynchronous transfers.</p> <p><i>Note: The value configuration class, postBuildVariantValue and postBuildVariantMultiplicity is deviated from AUTOSAR due to this parameter is used for generating the macro which indicates the type of communication is allowed on QSPI HW.</i></p>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucEnumerationParamDef
<b>Range</b>	ASYNCHRONOUS: SYNCHRONOUS:		
<b>Default value</b>	ASYNCHRONOUS		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar version 4.2.2.		

**1.3.1.14.4 SpiJobEndNotification**
**Table 86 Specification for SpiJobEndNotification**

<b>Name</b>	SpiJobEndNotification
-------------	-----------------------

(table continues...)

**1 Spi driver**
**Table 86 (continued) Specification for SpiJobEndNotification**

<b>Description</b>	<p>This parameter defines the notification function name or function address. In case of function name, a function by this name must be defined in an application and will be called at end of job transmission.</p> <p>Significant if SpiLevelDelivered is 1 or 2.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- In Level-2, notification will be provided only for asynchronous communications as the configuration of notification is enabled by default. This is applicable for 4.4.0</li> <li>- This configuration parameter depends on SpiHwUnitSynchronous, only in AUTOSAR 4.2.2</li> <li>- The Spi driver does not validate the configured function name or address for correctness and the responsibility is on the user</li> <li>- If SpiJobEndNotification is enabled, the value for the configuration parameter cannot be left blank. It should always contain a valid identifier name(Following C identifier naming rules) or it can hold a integer value or it can have a default value NULL_PTR</li> </ul>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucFunctionNameDef
<b>Range</b>	String		
<b>Default value</b>	NULL_PTR		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	TRUE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiHwUnitSynchronous, SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.14.5 SpiJobId**
**Table 87 Specification for SpiJobId**

<b>Name</b>	SpiJobId
-------------	----------

(table continues...)

**1 Spi driver**
**Table 87 (continued) Specification for SpiJobId**

<b>Description</b>	This ID is assigned to job.  <i>Note:</i> - Due to Multi-core implementation physical and logical job ids are to be generated. Logical job ids are numbered sequentially, however in the configuration physical memory location can be different due to assignment of jobs to sequences of different cores - Application should always use the same job id generated as per the Spi_Cfg.h file for accessing job information. ex: SpiConf_SpiJobs_(x). x is derived from the name provided by the user in the configuration - ID - 0xFFFF (65535) value is used as delimiter to indicate the end of job-id list  By Default value of ID is set to '0' however the value is auto-incremented if more than one job is added.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 4999		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.14.6 SpiJobPriority**
**Table 88 Specification for SpiJobPriority**

<b>Name</b>	SpiJobPriority		
<b>Description</b>	This parameter defines the priority of a job. 0 - lowest, 3 - highest priority  By default priority of all jobs are set to '0' so that all jobs are scheduled as round-robin.		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 3		
<b>Default value</b>	0		
<b>Post-build variant value</b>	TRUE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL

<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiHwUnitSynchronous, SpiInterruptibleSeqAllowed, SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

**1.3.1.16.2 SpiJobAssignment**
**Table 91 Specification for SpiJobAssignment**

<b>Name</b>	SpiJobAssignment		
<b>Description</b>	<p>This parameter should reference to a list of jobs.</p> <p>Jobs have priorities assigned. Jobs linked in a Sequence must have decreasing priorities. That means the first Job must have the highest priority of all Jobs within the Sequence</p> <p><i>Note1: The postBuildVariantMultiplicity is set to FALSE because this parameter is used to generate macro for total number of sequences configured per core.</i></p> <p>Error:</p> <p>A sequence cannot have Jobs on different QSPI Hardware modules otherwise configuration error is shown to rectify the same.</p> <p><i>Note2: If the jobs assigned are mapped to both Asynchronous and Synchronous bus then configuration error will be reported. This is applicable only for AUTOSAR 4.2.2.</i></p>		
<b>Multiplicity</b>	1..*	<b>Type</b>	EcucReferenceDef
<b>Range</b>	Reference to Node: SpiJob		

**(table continues...)**

## 1 Spi driver

**Table 91 (continued) Specification for SpiJobAssignment**

<b>Default value</b>	None		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	FALSE
<b>Value configuration class</b>	Post-Build	<b>Multiplicity configuration class</b>	Post-Build
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

### 1.3.1.16.3 SpiSeqEndNotification

**Table 92 Specification for SpiSeqEndNotification**

<b>Name</b>	SpiSeqEndNotification		
<b>Description</b>	<p>This parameter defines the notification function name or function address called after sequence transmission. A function by this type must be defined in an application and defined in Tresos.</p> <p>Significant only if SpiLevelDelivered is 1 or 2.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- In Level-2, notification will be provided only for asynchronous communications as the configuration of notification is enabled by default. This is applicable for 4.4.0</li> <li>- The Spi driver does not validate the configured function name or address for correctness and the responsibility is on the user</li> <li>- If SpiSeqEndNotification is enabled, the value for the configuration parameter cannot be left blank. It should always contain a valid identifier name(Following C identifier naming rules) or it can hold an integer value or it can have a default value NULL_PTR</li> <li>- This parameter has a dependency on SpiHwUnitSynchronous configuration parameter only in AUTOSAR 4.2.2</li> </ul>		
<b>Multiplicity</b>	0..1	<b>Type</b>	EcucFunctionNameDef
<b>Range</b>	String		
<b>Default value</b>	NULL_PTR

<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	LOCAL
<b>Dependency</b>	SpiHwUnitSynchronous, SpiLevelDelivered		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1 Spi driver

### 1.3.1.16.4 SpiSequenceId

**Table 93 Specification for SpiSequenceId**

<b>Name</b>	SpiSequenceId		
<b>Description</b>	<p>This ID is assigned to sequence.</p> <p>Default value is set to '0', however on adding multiple sequences id is automatically incremented.</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- Due to Multi-core implementation physical and logical sequence ids are to be generated. Logical job ids are numbered sequentially, however in the configuration physical memory location can be different due to assignment of sequence to different cores / kernels</li> <li>- Application should always use the same sequence id generated as per the Spi_Cfg.h file for accessing sequence information. ex: SpiConf_SpiSequence_(x). x is derived from the name provided by the user in the configuration</li> <li>- 0xFF (255) is used as delimiter, this value cannot be used for ID</li> </ul>		
<b>Multiplicity</b>	1..1	<b>Type</b>	EcucIntegerParamDef
<b>Range</b>	0 - 254		
<b>Default value</b>	0		
<b>Post-build variant value</b>	FALSE	<b>Post-build variant multiplicity</b>	-
<b>Value configuration class</b>	Pre-Compile	<b>Multiplicity configuration class</b>	-
<b>Origin</b>	AUTOSAR_ECUC	<b>Scope</b>	ECU
<b>Dependency</b>	-		
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.		

## 1.3.2 Functions - Type definitions

This section lists all the data types of the SPI driver.

### 1.3.2.1 Spi\_AsyncModeType

**Table 94 Specification for Spi\_AsyncModeType**

<b>Syntax</b>	Spi_AsyncModeType	
<b>Type</b>	Enumeration	
<b>File</b>	Spi.h	
<b>Range</b>	0 - SPI_POLLING_MODE	The asynchronous mechanism is ensured by polling, so interrupts (PT2, Error and DMA channel completion) related to the SPI busses are disabled.

(table continues...)

## 1 Spi driver

**Table 94 (continued) Specification for Spi\_AsyncModeType**

	1 - SPI_INTERRUPT_MODE	The asynchronous mechanism is ensured by interrupts, so interrupts (PT2, Error and DMA channel completion) related to the SPI busses are enabled.
<b>Description</b>	This variable indicates if all the kernels are executing in POLLING or INTERRUPT mode. This data type will be available or not according to the pre compile time parameter SPI_LEVEL_DELIVERED.  This type is only relevant for LEVEL 2.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.2 Spi\_ConfigType

**Table 95 Specification for Spi\_ConfigType**

<b>Syntax</b>	Spi_ConfigType	
<b>Type</b>	Structure	
<b>File</b>	Spi.h	
<b>Range</b>	-[]	None
<b>Description</b>	This structure holds the configuration of all the cores containing sequence, job, channel and Hardware unit information required to configure Hardware and transmit data over SPI interface.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.3 Spi\_JobEndNotificationType

**Table 96 Specification for Spi\_JobEndNotificationType**

<b>Syntax</b>	Spi_JobEndNotificationType	
<b>Type</b>	Pointer to a function of type void Function_Name ( void )	
<b>File</b>	Spi.h	
<b>Description</b>	Callback routine type for each Job to notify the caller that a job has been finished.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.4 Spi\_JobResultType

**Table 97 Specification for Spi\_JobResultType**

<b>Syntax</b>	Spi_JobResultType	
---------------	-------------------	--

(table continues...)

**1 Spi driver**
**Table 97 (continued) Specification for Spi\_JobResultType**

<b>Type</b>	Enumeration	
<b>File</b>	Spi.h	
<b>Range</b>	0 - SPI_JOB_OK	The last transmission of the job has been finished successfully.
	1 - SPI_JOB_PENDING	The SPI Handler/Driver is performing (transmitting) a specific SPI job. The meaning of this status is equal to SPI_BUSY.
	2 - SPI_JOB_FAILED	The last transmission of the job has failed.
	3 - SPI_JOB_QUEUED	An asynchronous transmission of a Job has been accepted, while actual transmission for this Job has not started yet.
<b>Description</b>	This type defines a range of specific Jobs status for SPI Handler/Driver. It informs about a SPI Handler/Driver job status and can be obtained calling the API service Spi_GetJobResult with the job ID.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.5 Spi\_LoopBackType**
**Table 98 Specification for Spi\_LoopBackType**

<b>Syntax</b>	Spi_LoopBackType	
<b>Type</b>	Enumeration	
<b>File</b>	Spi.h	
<b>Range</b>	0 - SPI_LOOPBACK_DISABLE	Disables the Loopback mode
	1 - SPI_LOOPBACK_ENABLE	Enables the Loopback mode
<b>Description</b>	This type is used to enable/disable the loopback feature.	
<b>Source</b>	IFX	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.6 Spi\_SeqEndNotificationType**
**Table 99 Specification for Spi\_SeqEndNotificationType**

<b>Syntax</b>	Spi_SeqEndNotificationType
<b>Type</b>	Pointer to a function of type void Function_Name ( void )
<b>File</b>	Spi.h

(table continues...)

## 1 Spi driver

**Table 99 (continued) Specification for Spi\_SeqEndNotificationType**

<b>Description</b>	Callback routine type for each Sequence to notify the caller that a sequence has been finished.
<b>Source</b>	AUTOSAR
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.

### 1.3.2.7 Spi\_SeqResultType

**Table 100 Specification for Spi\_SeqResultType**

<b>Syntax</b>	Spi_SeqResultType	
<b>Type</b>	Enumeration	
<b>File</b>	Spi.h	
<b>Range</b>	0 - SPI_SEQ_OK	The last transmission of the sequence has been finished successfully.
	1 - SPI_SEQ_PENDING	The SPI Handler/Driver is performing a specific SPI sequence. The meaning of this status is equal to SPI_BUSY.
	2 - SPI_SEQ_FAILED	The last transmission of the sequence has failed.
	3 - SPI_SEQ_CANCELLED	The last transmission of the sequence has been cancelled by user
<b>Description</b>	This type defines a range of specific sequences status for SPI Handler/Driver. It informs about a SPI Handler/Driver sequence status and can be obtained calling the API service Spi_GetSequenceResult with the sequence ID.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.8 Spi\_StatusType

**Table 101 Specification for Spi\_StatusType**

<b>Syntax</b>	Spi_StatusType	
<b>Type</b>	Enumeration	
<b>File</b>	Spi.h	
<b>Range</b>	0 - SPI_UNINIT	The SPI Handler/Driver is not initialized or not usable (state after reset).
	1 - SPI_IDLE	The SPI Handler/Driver is not currently transmitting any jobs.
	2 - SPI_BUSY	The SPI Handler/Driver is performing a SPI job (transmit).

(table continues...)

## 1 Spi driver

**Table 101 (continued) Specification for Spi\_StatusType**

<b>Description</b>	This type defines a range of specific status for SPI Handler/Driver. It informs about the SPI Handler/Driver status and can be obtained calling the API service Spi_GetStatus or the configurable Spi_GetHWUnitStatus.
<b>Source</b>	AUTOSAR
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.

### 1.3.2.9 Spi\_DataBufferType

**Table 102 Specification for Spi\_DataBufferType**

<b>Syntax</b>	Spi_DataBufferType	
<b>Type</b>	uint8	
<b>File</b>	Spi.h	
<b>Range</b>	0-255	
<b>Description</b>	Type of application data buffer elements. <i>Note:</i> - Channel width > 8, the SPI driver uses type uint16 to read or write the buffer. Similarly if channel width > 16, the SPI driver uses type uint32 to read or write the buffer. The SPI Driver will access the buffer as per little endian format (in accordance to architecture) - For 16-bit/32-bit transfer (Channel data width >8) user data have to be word aligned	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.2.10 Spi\_NumberOfDataType

**Table 103 Specification for Spi\_NumberOfDataType**

<b>Syntax</b>	Spi_NumberOfDataType	
<b>Type</b>	uint16	
<b>File</b>	Spi.h	
<b>Range</b>	0-65535	
<b>Description</b>	Type for defining the number of data elements of the type Spi_DataBufferType to send and/or receive by channel.  For Range details refer below parameters: - SpiIBNBuffers - SpiEBMaxLength	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Spi driver**
**1.3.2.11 Spi\_ChannelType**
**Table 104 Specification for Spi\_ChannelType**

<b>Syntax</b>	Spi_ChannelType	
<b>Type</b>	uint8	
<b>File</b>	Spi.h	
<b>Range</b>	0-255	
<b>Description</b>	Specifies the identification (ID) for a Channel.  Channel ID can be from 0-254. Value 255 is used as delimiter to identify if last channel is reached in the channel list. This is a deviation from AUTOSAR.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.12 Spi\_JobType**
**Table 105 Specification for Spi\_JobType**

<b>Syntax</b>	Spi_JobType	
<b>Type</b>	uint16	
<b>File</b>	Spi.h	
<b>Range</b>	0-65535	
<b>Description</b>	Specifies the identification (ID) for a Job.  Job ID can be from 0-65535. Value 65535 is used as delimiter to identify if last job in a job list. This is a deviation from AUTOSAR.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.13 Spi\_SequenceType**
**Table 106 Specification for Spi\_SequenceType**

<b>Syntax</b>	Spi_SequenceType	
<b>Type</b>	Spi_SequenceType	
<b>File</b>	Spi.h	
<b>Range</b>	0-255	
<b>Description</b>	Specifies the identification (ID) for a sequence of jobs.  Sequence ID can be from 0-254. Value 255 is used as delimiter to identify last sequence in sequence list. This is a deviation from AUTOSAR.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Spi driver

### 1.3.2.14 Spi\_HWUnitType

**Table 107** Specification for Spi\_HWUnitType

<b>Syntax</b>	Spi_HWUnitType	
<b>Type</b>	uint8	
<b>File</b>	Spi.h	
<b>Range</b>	0-255	
<b>Description</b>	Specifies the identification (ID) for a SPI Hardware microcontroller peripheral (unit). Range details: - Module no (bit [0:3]): QSPI $x$ , where the range of $x$ depends on the microcontroller derivative - Channel no (bit [4:7]): Channel0-channel15	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.3 Functions - APIs

This section lists all the APIs of the SPI driver.

#### 1.3.3.1 Spi\_AsyncTransmit

**Table 108** Specification for Spi\_AsyncTransmit API

<b>Syntax</b>	<pre>Std_ReturnType Spi_AsyncTransmit (     const Spi_SequenceType Sequence )</pre>	
<b>Service ID</b>	0x03	
<b>Sync/Async</b>	Asynchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	Sequence	Sequence ID.
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-

(table continues...)

**1 Spi driver**
**Table 108 (continued) Specification for Spi\_AsyncTransmit API**

<b>Return</b>	Std_ReturnType	<p>E_OK: Transmit request accepted</p> <p>E_NOT_OK: In the cases as follows</p> <ul style="list-style-type: none"> <li>-Driver is not initialized</li> <li>-Invalid sequence parameter</li> <li>-Job is not able to fit in Job queue(Job queue is full)</li> <li>-Sequence is already in SPI_SEQ_PENDING state</li> <li>-Given Sequence shares the job with another sequence which is in SPI_SEQ_PENDING state</li> <li>-If DMA channels are not configured, applicable only for AUTOSAR 4.4.0</li> <li>-If Move counter limit exceeds, applicable only for AUTOSAR 4.4.0</li> </ul>
<b>Description</b>	<p>This API transmits the sequence asynchronously over the QSPI interface. This API is asynchronous, which means the application invoking the API is not blocked till the sequence is transmitted completely and completion of transmission would be notified (if configured).</p> <p><i>Note:</i></p> <ul style="list-style-type: none"> <li>- Before calling Spi_AsyncTransmit() API, user must ensure to call Spi_SetupEB for EB channels or Spi_WriteIB for IB channels(but before the Spi_ReadIB call)</li> <li>- The API is enabled only if SpiLevelDelivered is 1 or 2</li> <li>- From multicore perspective, sequences assigned to core can only be transmitted else SPI_E_NOT_CONFIGURED DET will be returned</li> <li>- Sequence ID to be used by application will be of format - SpiConf_SpiSequence_(x), x is user defined string for ex: SpiConf_SpiSequence_EEPROM_Write</li> <li>- Spi_AsyncTransmit() API will enable the interrupts only during asynchronous transmission and once the transmission is complete, interrupts are disabled</li> </ul>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	SPI_E_PARAM_SEQ, SPI_E_UNINIT, SPI_E_SEQ_PENDING, SPI_E_NOT_CONFIGURED, SPI_E_QUEUE_FULL, SPI_E_DMA_CHANNEL_NOT_CONFIGURED, SPI_E_MOVECOUNTER_LIMIT_EXCEEDED	
<b>Configuration dependencies</b>	SpiLevelDelivered	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r), DMA_CH_ADICR(rw), DMA_CH_CHCFGR(w), DMA_CH_CHCSR(w), DMA_CH_DADR(w), DMA_CH_RDCRCR(w), DMA_CH_SADR(w), DMA_CH_SDCRCR(w), DMA_CH_SHADR(rw), DMA_TSR(rw), P_OMR(w), QSPI_BACONENTRY(w), QSPI_ECON(w), QSPI_FLAGSCLEAR(w), QSPI_GLOBALCON(rw), QSPI_GLOBALCON1(w), QSPI_MC(w), QSPI_MCCON(w)	
	<p><i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i></p>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Spi driver**
**1.3.3.2 Spi\_Cancel**
**Table 109 Specification for Spi\_Cancel API**

<b>Syntax</b>	<pre>void Spi_Cancel (     const Spi_SequenceType Sequence )</pre>	
<b>Service ID</b>	0x0C	
<b>Sync/Async</b>	Asynchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	Sequence	Sequence ID.
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	<p>This API cancels the on-going sequence transmission. Sets the sequence status to SPI_SEQ_CANCELLED and job status to SPI_JOB_OK. If any sequence notification is set, same will be called after completion of the ongoing job.</p> <p>In Multicore context, only the sequence assigned to core in which the API has been called can only be cancelled else respective error will be returned.</p> <p><i>Note:</i></p> <p><i>Calling Spi_Cancel() cancels the successive job of ongoing sequence being transmitted and updates the sequence status to cancelled. However updating the QSPI HW unit status to IDLE only happens once the ongoing job transmission is completed. So calling Spi_GetHwUnitStatus or Spi_GetStatus immediately after Spi_Cancel will return SPI_BUSY due to ongoing job.</i></p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	SPI_E_UNINIT, SPI_E_NOT_CONFIGURED, SPI_E_PARAM_SEQ	
<b>Configuration dependencies</b>	SpiCancelApi	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Spi driver

### 1.3.3.3 Spi\_ControlLoopBack

**Table 110 Specification for Spi\_ControlLoopBack API**

<b>Syntax</b>	<pre>Std_ReturnType Spi_ControlLoopBack (     const Spi_HWUnitType HWUnit,     const Spi_LoopBackType EnableOrDisable )</pre>	
<b>Service ID</b>	0x25	
<b>Sync/Async</b>	Synchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant for different QSPI HW	
<b>Parameters (in)</b>	HWUnit EnableOrDisable	Specifies the QSPI HW unit Specifies enable/disable the loopback mode
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: If the loopback mode enable/disable is successful E_NOT_OK: In case of - Driver is not initialized - Invalid parameters - HW unit is busy
<b>Description</b>	This API enables/disables the Loopback mode.  <i>Note :</i> When Spi_ControlLoopBack API is invoked, upper layer must ensure that no other thread is starting a new sequence on the same HW until Spi_ControlLoopBack API has completed its execution.	
<b>Source</b>	IFX	
<b>Error handling</b>	SPI_E_PARAM_UNIT, SPI_E_UNINIT, SPI_E_SAFETY_INVALID_PARAM	
<b>Configuration dependencies</b>	SpiEnableLoopBackApi	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r), QSPI_GLOBALCON(rw)  <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

## 1 Spi driver

### 1.3.3.4 Spi\_DeInit

**Table 111 Specification for Spi\_DeInit API**

<b>Syntax</b>	Std_ReturnType Spi_DeInit (     void )	
<b>Service ID</b>	0x01	
<b>Sync/Async</b>	Synchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	-	-
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Std_ReturnType	E_OK: de-initialization command has been accepted E_NOT_OK: In case of - Driver is not initialized - Driver is busy in transmission
<b>Description</b>	<p>This API de-initializes the hardware and global variables related to SPI driver. The API must be called only after module initialization and is accepted to be processed only when the device is in IDLE state.</p> <p>In multicore context, this API can be called by any core, only the kernel information associated with the caller core will be de-initialized other core still continue to work.</p> <p><i>Note: This API resets all the registers including runtime registers as well.</i></p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	SPI_E_UNINIT	
<b>Configuration dependencies</b>	-	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r), QSPI_CLC(w), QSPI_ECON(w), QSPI_FLAGSCLEAR(w), QSPI_GLOBALCON(w), QSPI_GLOBALCON1(w), QSPI_PISEL(w), QSPI_SSOC(w), SCU_CCUCON0(r), SCU_EICON0(rw), SCU_OSCCON(r), SCU_SYSPLLCON0(r), SCU_SYSPLLCON1(r), STM_TIM0(r) <p><i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i></p>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Spi driver**
**1.3.3.5 Spi\_GetHWUnitStatus**
**Table 112 Specification for Spi\_GetHWUnitStatus API**

<b>Syntax</b>	<pre>Spi_StatusType Spi_GetHWUnitStatus (     const Spi_HWUnitType HWUnit )</pre>	
<b>Service ID</b>	0x0B	
<b>Sync/Async</b>	Synchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	HWUnit	QSPI kernel Id
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Spi_StatusType	SPI_UNINIT: In case of - Driver is not initialized - Invalid HW unit parameter - HW unit is not configured for the core SPI_IDLE: The QSPI Hardware is not currently transmitting any Job SPI_BUSY: The QSPI Hardware is performing a SPI Job (transmit)
<b>Description</b>	<p>This API returns the status of the Hardware kernel requested for, If the QSPI kernel is busy transmitting a sequence SPI_BUSY is returned else SPI_IDLE is returned.</p> <p>In multicore context, API will be able to get the status of the kernels assigned to core on which the request is made, kernel assigned to different cores status cannot be obtained and returns un-predictable results.</p>	
<b>Source</b>	AUTOSAR	
<b>Error handling</b>	SPI_E_PARAM_UNIT, SPI_E_UNINIT	
<b>Configuration dependencies</b>	SpiHwStatusApi	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r) <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Spi driver**
**1.3.3.6 Spi\_GetJobResult**
**Table 113 Specification for Spi\_GetJobResult API**

<b>Syntax</b>	<pre>Spi_JobResultType Spi_GetJobResult (     const Spi_JobType Job )</pre>	
<b>Service ID</b>	0x07	
<b>Sync/Async</b>	Synchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant	
<b>Parameters (in)</b>	Job	Job ID.
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	Spi_JobResultType	<p>SPI_JOB_OK: The last transmission of the job has been finished successfully</p> <p>SPI_JOB_PENDING: The SPI Handler/Driver is performing (transmitting) a specific SPI job. The meaning of this status is equal to SPI_BUSY</p> <p>SPI_JOB_FAILED: In case of</p> <ul style="list-style-type: none"> <li>- Driver is not initialized</li> <li>- Job is not within the configured job range for core</li> <li>- Job is not assigned to the core</li> <li>- The last transmission of the job has failed</li> </ul> <p>SPI_JOB_QUEUED: An asynchronous transmission of a Job has been accepted, while actual transmission for this Job has not started yet</p>
<b>Description</b>	<p>This service returns the last transmission result of the specified Job. API returns the status of the job depending on whether job is queued, failed, pending or successful.</p> <p>In multicore context, API can only return the status of the jobs that are assigned to core in which API is called.</p> <p><i>Note: It is recommended to call this API from the notification function when notification is enabled to avoid the stale data problems.</i></p>

## 1 Spi driver

### 1.3.6.2 Spi\_IsrQspiPT2

**Table 128 Specification for Spi\_IsrQspiPT2 API**

<b>Syntax</b>	<pre>void Spi_IsrQspiPT2 (     const uint8 Module )</pre>	
<b>Service ID</b>	0x22	
<b>Sync/Async</b>	Synchronous	
<b>Safety Level</b>	Refer to the release notes for the safety related info	
<b>Re-entrancy</b>	Reentrant for different HW unit	
<b>Parameters (in)</b>	Module	QSPI module index [0 – 5]
<b>Parameters (out)</b>	-	-
<b>Parameters (in - out)</b>	-	-
<b>Return</b>	void	-
<b>Description</b>	PT2 - Phase transition interrupt signals one out of all phases of Hardware state transition. This Interrupt Service routine marks the end of the frame transmission and is triggered only at the end of the job transmission. Total number of elements to be transmitted in a next job is updated in the MCCOUNT during this interrupt and respective DMA channels are re-triggered.	
<b>Source</b>	IFX	
<b>Error handling</b>	SPI_E_HARDWARE_ERROR, SPI_E_SAFETY_INVALID_PARAM, SPI_E_SAFETY_SPURIOUS_INTERRUPT	
<b>Configuration dependencies</b>	SpiLevelDelivered	
<b>User hints</b>	-	
<b>SFR accessed</b>	CPU_CORE_ID(r), DMA_CH_ADICR(rw), DMA_CH_CHCFGR(w), DMA_CH_CHCSR(w), DMA_CH_DADR(w), DMA_CH_RDCRCR(w), DMA_CH_SADR(w), DMA_CH_SDCRCR(w), DMA_CH_SHADR(rw), DMA_TSR(rw), P_OMR(w), QSPI_BACONENTRY(w), QSPI_ECON(w), QSPI_FLAGSCLEAR(w), QSPI_GLOBALCON(rw), QSPI_GLOBALCON1(rw), QSPI_MC(w), QSPI_MCCON(w), QSPI_STATUS(r)  <i>Note : The list includes all the SFRs accessed in the context of the API. It lists the SFRs accessed by the driver and called interfaces from other drivers. During runtime, the SFRs accessed from this list may vary based on configuration and execution context.</i>	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

### 1.3.7 Callout

The driver does not support any callout functions.

**1 Spi driver****1.3.8 Errors Handling**

This section describes the various errors reported by the SPI driver.

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>SPI_E_ALREADY_INITIALIZED:</b> API SPI_Init service called while the SPI driver has already been initialized.	AUTOSAR	0x4A	DET_SAFETY	0x4A	DET_SAFETY
<b>SPI_E_DMA_CHANNEL_NOT_CONFIGURED:</b> DMA channels are not configured for a QSPI. <i>Note: This is applicable only for AUTOSAR 4.4.0(Level-2 Configuration).</i>	IFX	NA	NA	0x67	DET_SAFETY

**1 Spi driver**

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>SPI_E_HARDWARE_ERROR:</b> In AUTOSAR 4.2.2: - On any error bit set in status register: Mcal_Wrapper_Dem_ReportErrorStatus (SPI_E_HARDWARE_ERROR, DEM_EVENT_STATUS_FAILED) - If no error is reported and successful transmission: Mcal_Wrapper_Dem_ReportErrorStatus (SPI_E_HARDWARE_ERROR, DEM_EVENT_STATUS_PASSED)  In AUTOSAR 4.4.0: - On any error bit set in status register: Mcal_Wrapper_Dem_SetEventStatus (SPI_E_HARDWARE_ERROR, DEM_EVENT_STATUS_FAILED) - If no error is reported and successful transmission: Mcal_Wrapper_Dem_SetEventStatus (SPI_E_HARDWARE_ERROR, DEM_EVENT_STATUS_PASSED)  If any error is reported, application needs to monitor and take appropriate action.  <i>Note: The SPI_E_HARDWARE_ERROR Production Error is raised for QSPI Hardware errors or DMA ME errors.</i>	AUTOSAR	Assigned by DEM	Production Error	Assigned by DEM	Production Error
<b>SPI_E_INIT_FAILED:</b> The DET SPI_E_INIT_FAILED is reported when the configuration set used during initialization is not same across all cores.	AUTOSAR	0x64	DET_SAFETY	0x64	DET_SAFETY

**1 Spi driver**

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>SPI_E_MOVECOUNTER_LIMIT_EXCEEDED:</b> When the cumulative number of data elements of all the channels configured for a job, crosses 8190 elements.  <i>Note: This is applicable only for LEVEL-2 configuration in both AUTOSAR 4.2.2 and AUTOSAR 4.4.0</i>	IFX	0x68	DET_SAFETY	0x68	DET_SAFETY
<b>SPI_E_NOT_CONFIGURED:</b> Sequence / job / channel number passed is not configured to core on which request is made but with-in the max range of sequence.  <i>Note: This is not applicable for APIs Spi_AsyncTransmit and Spi_SyncTransmit in AUTOSAR 4.4.0.</i>	AUTOSAR	0x4B	DET_SAFETY	0x4B	DET_SAFETY
<b>SPI_E_PARAM_CHANNEL:</b> Incorrect parameter passed in API.	AUTOSAR	0x0A	DET_SAFETY	0x0A	DET_SAFETY
<b>SPI_E_PARAM_JOB:</b> API service called with wrong parameter.	AUTOSAR	0x0B	DET_SAFETY	0x0B	DET_SAFETY
<b>SPI_E_PARAM_LENGTH:</b> Length parameter is greater than the defined limit.	AUTOSAR	0x0D	DET_SAFETY	0x0D	DET_SAFETY
<b>SPI_E_PARAM_POINTER:</b> APIs called with a null pointer.	AUTOSAR	0X10	DET_SAFETY	0X10	DET_SAFETY
<b>SPI_E_PARAM_SEQ:</b> API service called if the sequence ID is not in the range of the total sequence numbers allocated to all the cores.	AUTOSAR	0X0C	DET_SAFETY	0X0C	DET_SAFETY
<b>SPI_E_PARAM_UNIT:</b> API service called with wrong parameter.	AUTOSAR	0x0E	DET_SAFETY	0x0E	DET_SAFETY

**1 Spi driver**

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>SPI_E_QUEUE_FULL:</b> If a new sequence is requested to be transmitted and if slots are less than number of jobs in Queue this DET is raised. On this DET user can increase the Queue length in SpiJobQueueLengthQspix field.	AUTOSAR	0x4C	DET_SAFETY	0x4C	DET_SAFETY
<b>SPI_E_SAFETY_INVALID_PARAMETER:</b> - If an invalid parameter is passed to Spi_SetAsyncMode API, the mode will be changed to the polling mode. As a safety check this DET is added - If an invalid parameter is passed to ISR like wrong kernel which is not in range this safety DET will be triggered - A safety check DET is reported when an invalid parameter is passed to the EnableOrDisable parameter of the Spi_ControlLoopBack API - A safety check DET is reported when an invalid DMA channel number passed or invalid DMA channel event passed to Spi_QspiDmaCallout - A safety check DET is reported when an invalid DMA channel number passed to Spi_QspiDmaErrCallout	IFX	0x65	SAFETY	0x65	SAFETY
<b>SPI_E_SAFETY_SPURIOUS_INTERRUPT:</b> For every interrupt triggered, source of interrupt will be checked, if no source can be detected this safety error will be triggered.	IFX	0x66	SAFETY	0x66	SAFETY
<b>SPI_E_SEQ_IN_PROCESS:</b> Synchronous transmission service called at wrong time.	AUTOSAR	0X3A	DET_SAFETY	0X3A	RUNTIME
<b>SPI_E_SEQ_PENDING:</b> Indicates that sequence is in Pending state and requested action cannot be performed.	AUTOSAR	0X2A	DET_SAFETY	0X2A	RUNTIME

## 1 Spi driver

Error Name: Description	Source	Error ID (AS422)	Type (AS422)	Error ID (AS440)	Type (AS440)
<b>SPI_E_UNINIT:</b> API service used without module initialization.	AUTOSAR	0X1A	DET_SAFETY	0X1A	DET_SAFETY

### 1.3.9 Deviations and limitations

The section describes the deviations and limitations of the SPI driver.

#### 1.3.9.1 Deviations

The section describes the deviations of the SPI driver.

##### 1.3.9.1.1 Software specification deviations

This section describes the deviations from software specification.

**Table 129 Known deviations**

Reference	Deviation
For all requirements related to Production/Runtime errors	<p>Reporting of Production error: Dem_ReportErrorStatus is done through Mcal_Wrapper_Dem_ReportErrorStatus interface for AUTOSAR 4.2.2 and Dem_SetEventStatus is done through Mcal_Wrapper_Dem_SetEventStatus interface for AUTOSAR 4.4.0.</p> <p>Reporting of Runtime error: Det_ReportRuntimeError is done through Mcal_Wrapper_Det_ReportRuntimeError interface. This is applicable for only AUTOSAR 4.4.0.</p> <p>All production and runtime related datatypes and modified interfaces inclusion shall be done via Mcal_Wrapper.h</p>

##### 1.3.9.1.2 AMDC Violations

The SPI driver does not have any AMDC violations.

##### 1.3.9.1.3 VSMD Violations

This section describes the violations reported by the EB VSMD checker tool with respect to AUTOSAR.

Violations reported by VSMD checker tool for TpsEcuc\_06051\_ASR41

**Table 130 Table: Violations reported by VSMD checker tool for TpsEcuc\_06051\_ASR41**

Rule ID:	TpsEcuc_06051_ASR41
----------	---------------------

(table continues...)

**1 Spi driver**
**Table 130**      **(continued) Table: Violations reported by VSMD checker tool for**  
**TpsEcuc\_06051\_ASR41**

VSMD Node(s):	/AURIX2G/EcucDefs/Spi/POST_BUILD_VARIANT_USED /AURIX2G/EcucDefs/Spi/SpiDriver/SpiChannel/ SpiChannelType /AURIX2G/EcucDefs/Spi/SpiDriver/SpiChannel/ SpiDataWidth /AURIX2G/EcucDefs/Spi/SpiDriver/SpiChannel/ SpiNbBuffers /AURIX2G/EcucDefs/Spi/SpiDriver/SpiExternalDevice/ SpiHwUnit /AURIX2G/EcucDefs/Spi/SpiDriver/SpiJob/ SpiChannelList/SpiChannelAssignment /AURIX2G/EcucDefs/Spi/SpiDriver/SpiJob/ SpiHwUnitSynchronous
Description:	The implementationConfigClass of an EcucParameterDef or EcucAbstractReferenceDef in VSMD shall be the same or higher (where PreCompile configuration class is considered to be the lowest and PostBuild the highest) as in StMD with respect to the selected subset defined by the actually implemented supportedConfigVariant.

**1 Spi driver**
**Table 130**                      **(continued) Table: Violations reported by VSMD checker tool for**  
**TpsEcuc\_06051\_ASR41**

Additional information:	<p>The implementationConfigClass value is deviated from AUTOSAR due to the following reasons:</p> <ol style="list-style-type: none"> <li>1. SpiChannelType: This parameter specifies the buffer type (External Buffer / Internal Buffer) used by the channel. The value configured to this parameter may change only at pre-compile time since it is coupled with buffer size which cannot be changed across the variants. This parameter is used to generate a macro for total IB channels, EB channels and total IB buffer size configured for a core. Hence, the implementationConfigClass is pre-compile instead of post-build.</li> <li>2. SpiDataWidth: This parameter specifies the width of the data to be transmitted in terms of bits. The QSPI supports the data width from 2 to 32 bits. The value configured to this parameter may change only at pre-compile time. This parameter is used to generate a macro for total IB channels, EB channels and total IB buffer size configured for a core. Hence, the implementationConfigClass is pre-compile instead of post-build.</li> <li>3. SpiIbNBuffers: This parameter specifies the buffer size of the IB channels. The value configured to this parameter may change only at pre-compile time. This parameter is used to generate a macro for total IB channels, EB channels and total IB buffer size configured for a core. Hence, the implementationConfigClass is pre-compile instead of post-build.</li> <li>4. SpiHwUnit: This parameter specifies the SPI hardware microcontroller peripheral allocated for transmission. The value configured to this parameter may change only at pre-compile time. This parameter is used to generate a macro for total IB channels, EB channels and total IB buffer size configured for a core. Hence, the implementationConfigClass is pre-compile instead of post-build.</li> <li>5. SpiChannelAssignment: This parameter specifies the channel linked to this Job container. The value configured to this parameter may change only at pre-compile time. This parameter is used to generate a macro for total IB channels, EB channels and total IB buffer size configured for a core. Hence, the implementationConfigClass is pre-compile instead of post-build.</li> <li>6. SpiHwUnitSynchronous: This parameter specifies if a job is Synchronous or Asynchronous. The</li> </ol>

Rule ID:	EcucSws_6003
VSMD Node(s):	/AURIX2G/EcucDefs/Spi
Description:	The SHORT-NAME of the AR-PACKAGEs of StMD and VSMD must be different to ensure a unique SHORT- NAME-path.
Additional information:	-

**1.3.9.2 Limitations**

This section describes the limitations of SPI driver.

**Table 140 Known limitations**

Reference	Limitation
DMA Transaction control set (TCS) Memory alignment	SPI driver uses the DMA to perform asynchronous data transfer which inturn uses TCS to store the configuration of DMA. Behaviour of the DMA / SPI driver is un-predictable if the TCS is not aligned to 32-byte boundary. Ex: Spi_DmaTxControlSetArrayQSPI0 Rationale: DMA Hardware mandates TCS to be 32-byte aligned.

(table continues...)

**1 Spi driver**
**Table 140 (continued) Known limitations**

Reference	Limitation
Buffer alignment	<p>All buffers that are used for transmission and reception of data shall be aligned to 4-byte boundary.</p> <p>Rationale: Odd address access would create a trap.</p>
Sleep mode	<p>Application should ensure that there is no ongoing SPI communication when CPU is requested for sleep.</p> <p>Rationale: If CPU enters sleep mode, clock to peripheral modules would be turned OFF.</p>
Allowed IB buffer size per Core	<p>The maximum allowed IB buffer size per Core is 65535. This means user must ensure the sum of generated macros SPI_ASYNC_IB_BUFFER_SIZE_COREx and SPI_SYNC_IB_BUFFER_SIZE_COREx (where 'x' represents the coreId) should not cross 65536(Word aligned). In case of violation, Code generation throws an error.</p>
Cache and non-cache sections of memory	<p>The Global buffers Spi_TxIBBufferCorex, Spi_RxIBBufferCorex, Spi_DmaTxControlSetArrayQSPiX and Spi_DmaRxControlSetArrayQSPiX are extensively used by DMA for data transfer and for TCS, so memory sections for these global must not be cached. Note that EB buffers that are used by applications are to be allocated in non-cached section of memory.</p>
Unexpected Spurious interrupt during Error Handler	<p>If SPI driver encounters multiple errors during the transmission of a sequence, it could result in SPI_E_SAFETY_SPURIOUS_INTERRUPT error reported by the driver. Application needs to ignore any such spurious interrupt generated during transmission.</p> <p>Rationale: The error ISR is triggered more than once due to the pending interrupt in SRC register. This is seen when SPI driver encounters multiple errors during the transmission of a sequence, for the same HW module.</p>
SLSO on Power-on	<p>On power-up, before the first frame is transmitted to any slave device CS lines are held in low state. Before the start of first frame all the SLSO pins are de-asserted and only the selected slave is asserted. For Successive frames SLSO levels will behave as expected and this is observed for hardware triggered SLSO only. No functional impact is expected from this behaviour.</p>
DMA TRL (Transaction request lost) event	<p>TRL events are safety feature of DMA hardware and cannot be suppressed. TRL event will be triggered on completion of channel transfer. If the configuration parameter DmaTcsInterruptTransactionLoss is disabled in DMA module, though TRL interrupt event is triggered by hardware, the DMA driver processes the event but does not provide any notification to user application.</p>

**(table continues...)**

**1 Spi driver****Table 140** (continued) **Known limitations**

Reference	Limitation
Handling OS calls invoked by SPI Interrupt service routine in CAT1 context	If the runtime API mode (SpiRuntimeApiMode) is configured to SPI_MCAL_USER1, the SPI interrupt handler uses OS service to access supervisor privileged SFRs. Due to this, if the SPI interrupt handlers are invoked in CAT1 context, the application software must handle the OS service call invoked from SPI handler.
Address and Data CRC	The SPI driver does not implement the CRC mechanism provided by the DMA driver. It is the responsibility of the upper layer to perform the integrity check of the data by using additional CRC mechanisms.
SPI level 1 implementation	The SPI driver supports only interrupt mode with DMA in Level 1 implementation ( no support for polling mode provided).

## Revision history

## Revision history

**Table 141**      **Revision history**

Date	Version	Description
2023-06-30	7.0	Document is released
2023-06-12	6.1	<ul style="list-style-type: none"> <li>• Updated the section 1.1.2.Hardware-software mapping to include Mcal_Wrapper module and removed Dem module.</li> <li>• Updated the Section 1.1.3.C file Structure to include Mcal_Wrapper.h and removed Dem.h.</li> <li>• In Section 1.1.4.1.Integration with AUTOSAR stack, the following points are modified <ul style="list-style-type: none"> <li>- Instead of DEM Module, Mcal_Wrapper Section is added.</li> <li>- Moved Runtime Error description from DET to Mcal_Wrapper Module.</li> </ul> </li> <li>• In Section 1.3.8.Error Handling for SPI_E_HARDWARE_ERROR parameter Description is updated with Mcal_Wrapper API.</li> <li>• DEM has been modified to Production error in Section: 1.1.4.5.DMA support, 1.3.8.Error Handling.</li> <li>• Updated the section 1.3.9.1.1: Software Specification Deviations for Autosar requirements. <ul style="list-style-type: none"> <li>- Added the Reference "For all requirements related to Production/Runtime errors".</li> <li>- Updated Description to add Mcal_Wrapper Module Information.</li> </ul> </li> <li>• ASIL Level has been updated to Safety level in Section 1.3.3.Functions - APIs, 1.3.4. Notifications and Callbacks, 1.3.5. Scheduled Functions and 1.3.6. Interrupt service routines.</li> <li>• Updated the description of return type E_NOT_OK information in section 1.3.3.11.Spi_InitCheck() API.</li> </ul>
2022-07-06	6.0	Document is released
2022-07-04	5.1	<ul style="list-style-type: none"> <li>-SPI level 1 implementation Limitation is updated.</li> <li>-Default Value of following Configuration parameters has been changed <ol style="list-style-type: none"> <li>1.SpiDelayParamIdleLength</li> <li>2.SpiDelayParamIdlePre</li> <li>3.SpiDelayParamLeadLength</li> <li>4.SpiDelayParamLeadPre</li> <li>5.SpiDelayParamTrailLength</li> <li>6.SpiDelayParamTrailPre</li> </ol> </li> </ul>
2021-11-18	5.0	Document is released
2021-11-12	4.1	<ul style="list-style-type: none"> <li>- Config variant attribute table information is removed and added this information in 'Configuration interfaces' section</li> <li>- Updated example code snippet</li> <li>- Example usage section updated for the number and position of interrupts for a sample Spi sequence configuration</li> </ul>
