

# MCAL User Manual for Pwm\_17\_GtmCcu6

## 32-bit TriCore™ AURIX™ TC3xx microcontroller

### About this document

#### Scope and purpose

This User Manual is intended to enable users to integrate the Microcontroller Abstraction Layer (MCAL) software for the TriCore™ AURIX™ family of 32-bit microcontrollers.

This document describes responsibilities of integrator in-charge of integrating MCAL software with the basic software (BSW) stack. This document also provides detailed information on safety, configuration and functions along with examples of usage of significant features.

*Note:* Detailed information about package installation, safety and other generic information that are common across all modules are provided in MCAL User Manual General.

#### Intended audience

This document is intended for anyone using the Pwm\_17\_GtmCcu6 module of the TC3xx MCAL software.

#### Document conventions

**Table 1** Conventions

Convention	Explanation
<b>Bold</b>	Emphasizes heading levels, column headings, table and figure captions, screen names, windows, dialog boxes, menus, sub-menus
<i>Italics</i>	Denotes variable(s) and reference(s)
Courier	Denotes APIs, functions, interrupt handlers, events, data types, error handlers, file/folder names, directories, command line inputs, code snippets
New	
>	Indicates that a cascading sub-menu opens when you select a menu item
[cover parentID=<alpha numeric value>]	Used for traceability completeness. Reader should ignore these.

#### Reference documents

This User Manual should be read in conjunction with the following documents:

- AURIX™ TC3xx MCAL User Manual General
- Specification of PWM Driver, AUTOSAR\_SWS\_PWM\_Driver, AUTOSAR Release 4.2.2
- Specification of PWM Driver, AUTOSAR\_SWS\_PWM\_Driver, AUTOSAR Release 4.4.0

**1 Pwm\_17\_GtmCcu6 driver****1 Pwm\_17\_GtmCcu6 driver****1.1 User information****1.1.1 Description**

The pulse width modulation (PWM) driver is responsible for providing standard services related to the PWM signal generation specified by AUTOSAR. The underlying timer engine of a PWM channel is a GTM (TOM or ATOM slice) or CCU6 (T12 or T13 slice) timer channel. The PWM driver provides UI options to configure the driver parameters as described in the AUTOSAR PWM specification and additional parameters to configure the timer engine. The parameters of the GTM or CCU6 timer slice that must be configured are described in the MCU driver chapter.

**1.1.2 Hardware-software mapping**

This section describes the system view of the PWM driver and peripherals administered by it.

**1 Pwm\_17\_GtmCcu6 driver**

**Figure 1 Mapping of hardware-software interfaces**
**1.1.2.1 Port: dependent hardware peripheral**
**Hardware functional features**

The output signals are routed to the GTM and CCU6 through the port pads. The port pads are configured and enabled through the PORT driver.

**Users of the hardware**

The port pads are configured by the PORT driver.

**Hardware diagnostic features**

Not applicable.

**Hardware events**

Not applicable.

---

**1 Pwm\_17\_GtmCcu6 driver****1.1.2.2 GTM: primary hardware peripheral****Hardware functional features**

The PWM driver uses the TOM/ATOM sub-module of GTM for generating output signal for a configured duty cycle and period.

The PWM driver uses the TOM/ATOM sub-module for period, duty cycle and polarity updates.

The key GTM features used by the PWM driver are:

- Synchronous and asynchronous update of duty cycles and period
- Host trigger feature is used if a synchronous start is desired
- Signaling mechanisms: Global enable/disable mechanism, output enable mechanism
- Trigger mechanisms: Host CPU, the internal trigger signal (from current channel)
- Continuous counting up mode
- ATOM operation mode: Signal output mode PWM (SOMP)
- ATOM CPU controlled update

The unsupported features of the GTM are:

- Global force update signaling mechanism
- The TBU time stamp trigger mechanism
- Continuous counting up-down mode, one shot up mode, one shot down mode
- ATOM operational mode: SOMI/SOMC/SOMS/SOMB
- ATOM ARU controlled update
- Pulse count modulation mode
- Trigger generation
- TOM BLDC support
- TOM gated counter mode

**Users of the hardware**

The TOM/ATOM channel of the GTM is exclusively used by the PWM driver. The GTM TOM or ATOM channel can be used by the PWM, GPT, ADC, OCU, DSADC or WDG driver.

The MCU driver initializes the GTM clocks, timer to port pin connections and provides APIs to program the GTM SFRs. The PWM driver uses these APIs to write the GTM SFRs. Additionally, updates to channel-specific SFRs are performed by the PWM driver. Since these channels are exclusively reserved for the PWM driver, access to the channel-specific SFRs from other drivers or user software is not allowed. The MCU driver is responsible to route the GTM interrupt to the PWM driver.

**Hardware diagnostic features**

Not applicable.

**Hardware events**

The PWM driver uses the following hardware events from the TOM/ATOM sub-module of the GTM IP:

- Period match events generated by the timer channel
- Compare match events generated by the timer channel

**1.1.2.3 SCU: dependent hardware peripheral****Hardware functional features**

---

**1 Pwm\_17\_GtmCcu6 driver**

The PWM driver depends on the SCU IP for the clock functionality. The driver requires the fSPB, fGTM and fCCU6 clock signals for functioning.

**Users of the hardware**

The SCU IP supplies clock for all the peripherals and the MCU driver, and is responsible for configuring the clock tree. To avoid conflicts due to simultaneous writes, update to all the ENDINIT protected registers is performed using the MCALLIB APIs.

**Hardware diagnostic features**

The SMU alarms configured for the SCU IP are not monitored by the PWM driver.

**Hardware events**

Hardware events from the SCU are not used by the PWM driver.

**1.1.2.4 CCU6: primary hardware peripheral****Hardware functional features**

The PWM driver uses the CCU6 for generating output signal for a configured duty cycle and period.

The main features of the CCU6 functional block configured and accessed by the PWM driver are period, duty cycle and polarity update.

The key CCU6 features used by the PWM driver are:

- Edge-aligned operating mode
- Compare mode
- Interrupt generation at period-match and compare-match events
- Synchronous start: Host trigger feature is used if a synchronous start is required a. for T12 channels b. from T12 to T13 channel

The unsupported features of the CCU6 are:

- Hall sensor mode
- Trap handling of CCU6
- Capture mode for T12 and T13
- Multi-channel mode
- Center-aligned operating mode
- Generation of three-phase PWM
- Dead-time control
- Single-shot mode
- Start control by external events
- Counting of external events
- Hysteresis-like control mode
- Block commutation for Brushless DC-drives
- Noise filter for position input signals
- Automatic rotational speed measurement and commutation control for block commutation
- Integrated error handling

**Users of the hardware**

---

**1 Pwm\_17\_GtmCcu6 driver**

The T12/T13 channel of the CCU6 is exclusively used by the PWM driver. The CCU6 T12 or T13 channel can be used by the PWM, ICU driver.

The MCU driver provides APIs to program the CCU6 SFRs. The PWM driver uses these APIs to write the CCU6 SFRs. Additionally, updates to channel-specific SFRs are performed by the PWM driver. Since these channels are exclusively reserved for the PWM driver, access to the channel-specific SFRs from other drivers or user software is not allowed. The MCU driver is responsible to route the CCU6 interrupt to the PWM driver.

**Hardware diagnostic features**

Not applicable.

**Hardware events**

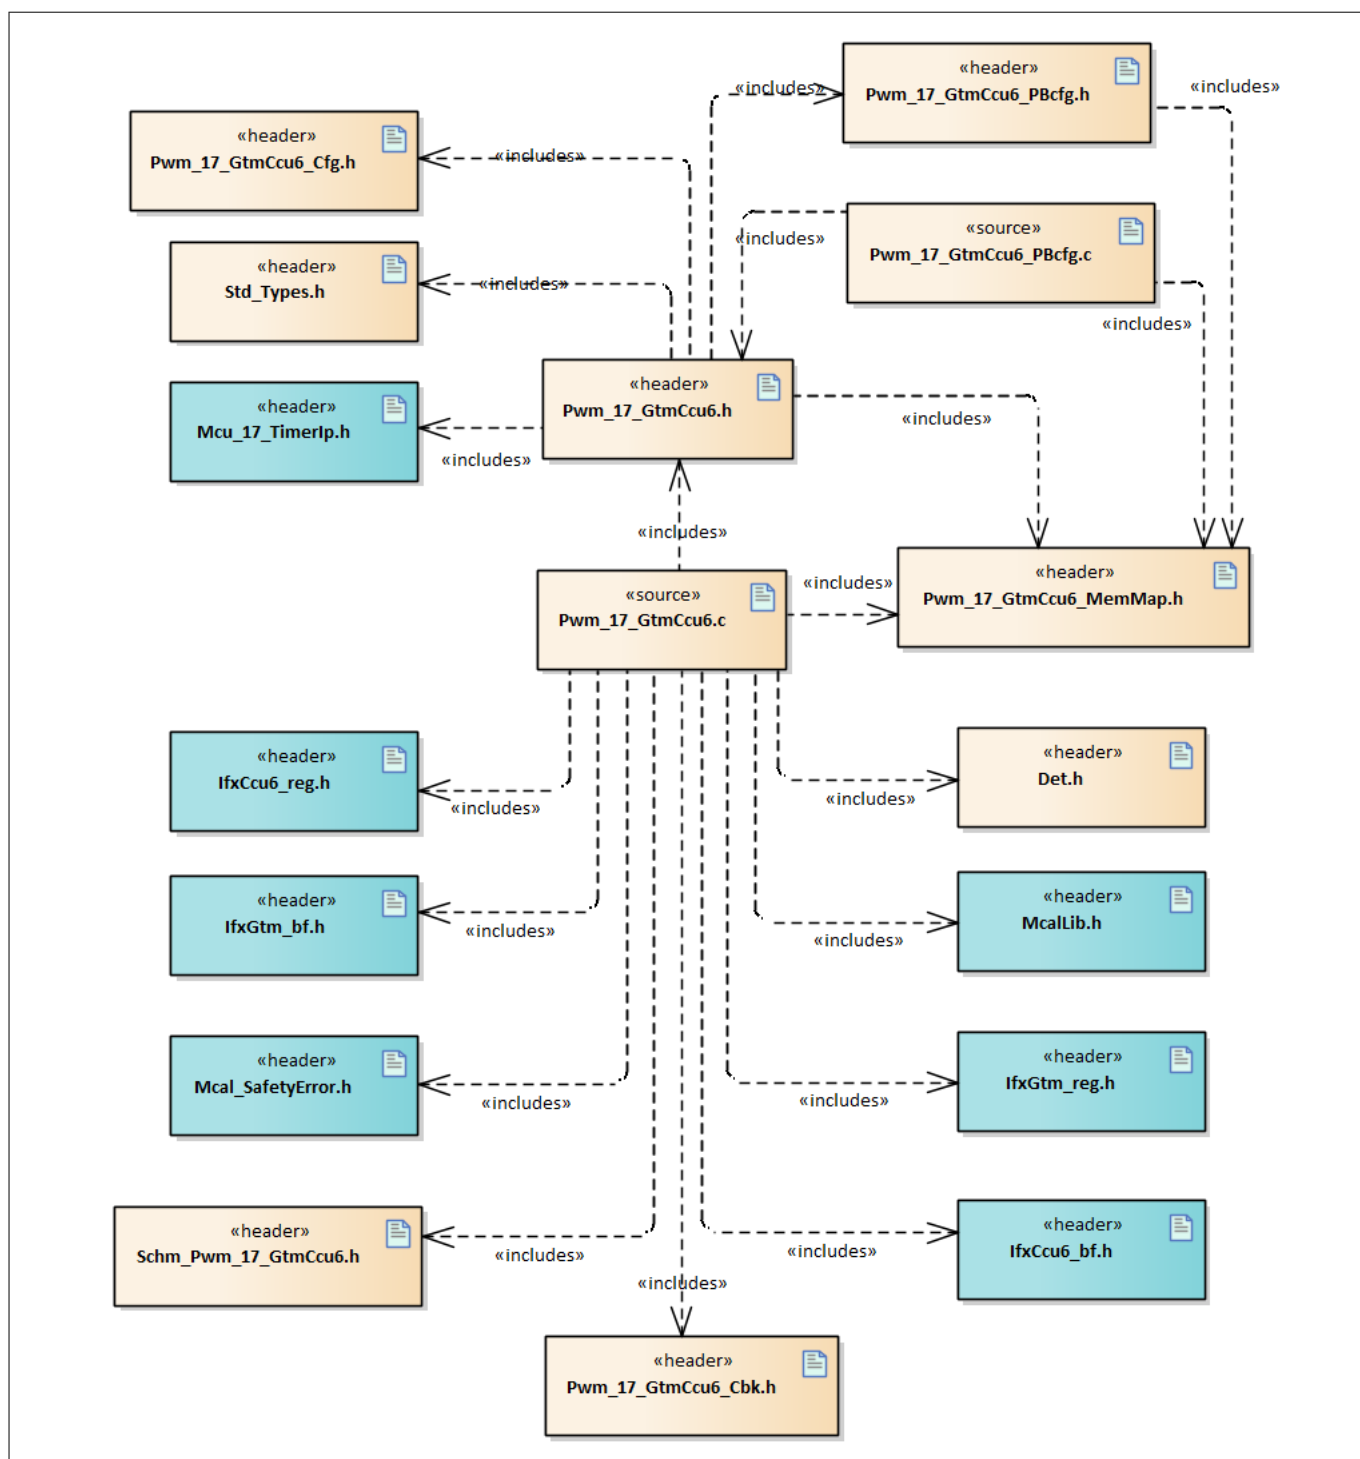

The PWM driver uses the following hardware events from the CCU6 IP:

- Period match events generated by the timer channel
- Compare match events generated by the timer channel

**1.1.3 File structure****1.1.3.1 C file structure**

This section provides details of the C files of the PWM driver.

### 1 Pwm\_17\_GtmCcu6 driver

**Figure 2** Pwm\_C\_file\_structure-1.png

**Table 2** C file structure

File name	Description
Det.h	Provides the exported interfaces of Development Error Tracer
IfxCcu6_bf.h	SFR header file for CCU6
IfxCcu6_reg.h	SFR header file for CCU6
IfxGtm_bf.h	SFR header file for GTM

(table continues...)

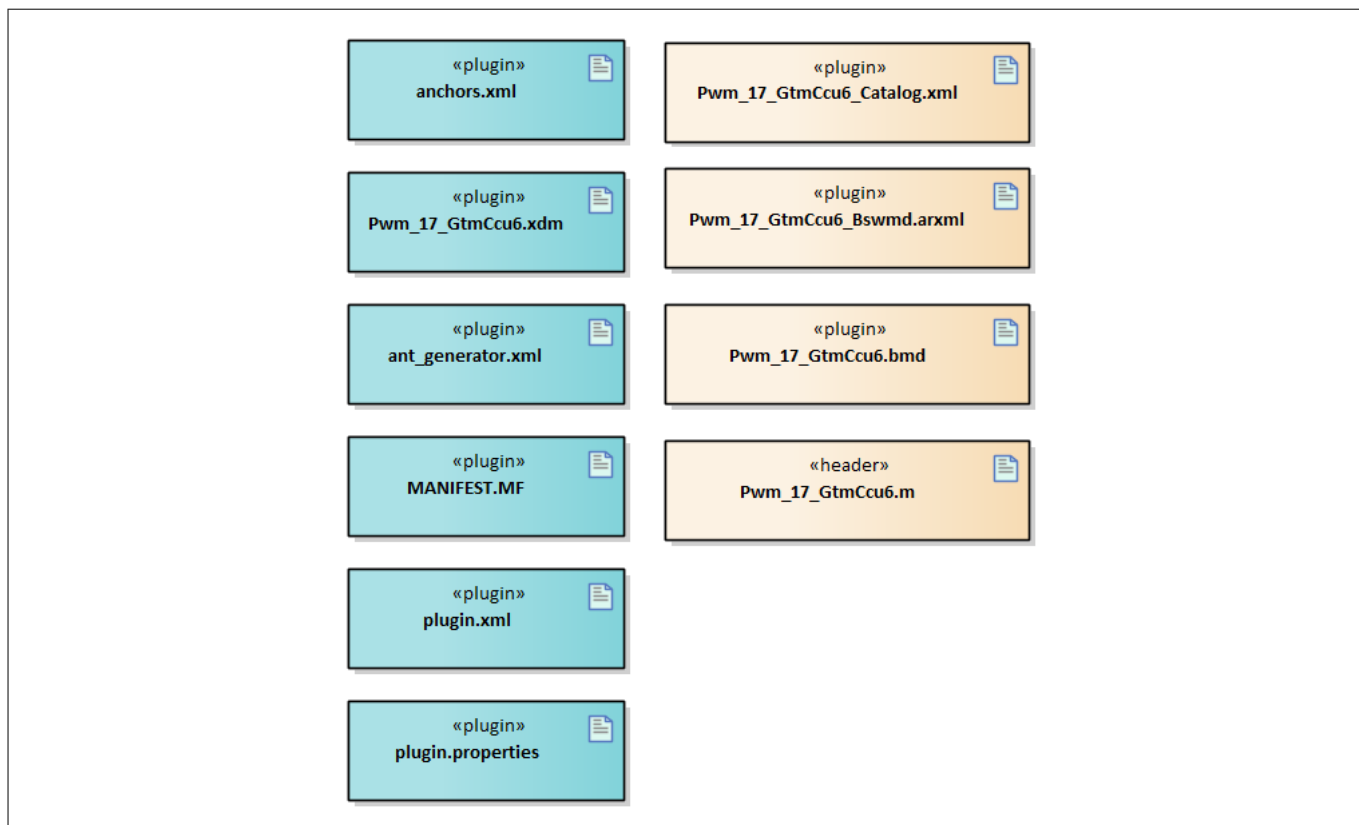

**1 Pwm\_17\_GtmCcu6 driver**
**Table 2 (continued) C file structure**

File name	Description
IfxGtm_reg.h	SFR header file for GTM
McalLib.h	Static header file defining prototypes of data structure and APIs exported by the MCALLIB.
Mcal_SafetyError.h	Header file containing the prototype of the API for reporting safety-related errors
Mcu_17_TimerIp.h	Header file defining prototypes of data structures and APIs of Timer IPs (GTM, CCU6 and GPT12), containing functions such as initialization, enable, interrupt handlers and other services and is included by Mcu_17_TimerIp.c source file
Pwm_17_GtmCcu6.c	Static source code containing API definition
Pwm_17_GtmCcu6.h	Header file (Static) defining prototypes of data structures and APIs. Header file implements all pre-processor directives.
Pwm_17_GtmCcu6_Cbk.h	Includes callback header definition
Pwm_17_GtmCcu6_Cfg.h	Header file (Generated) containing constants and pre-processor macros
Pwm_17_GtmCcu6_MemMap.h	Mapping of code and data (variables, constant variables) to specific memory sections
Pwm_17_GtmCcu6_PBcfg.c	File (Generated) containing objects to data structures
Pwm_17_GtmCcu6_PBcfg.h	Code template header file for the PWM driver that should be included by the application
Schm_Pwm_17_GtmCcu6.h	PWM critical sections are declared in this file
Std_Types.h	Standard type declaration file as defined by AUTOSAR. It is independent of compiler or platform.

**1.1.3.2 Code generator plugin files**

This section provides details of the code generator plugin files of the PWM driver.

## 1 Pwm\_17\_GtmCcu6 driver

**Figure 3** Pwm\_Code\_Generator\_Plugin\_Files-1.png

**Table 3** Code generator plugin files

File name	Description
MANIFEST.MF	Tresos plugin support file containing the meta data for the PWM driver
Pwm_17_GtmCcu6.bmd	AUTOSAR format XML data model schema file (for each device)
Pwm_17_GtmCcu6.m	File contains macros for the PWM code generation
Pwm_17_GtmCcu6.xdm	Tresos format XML data model schema file
Pwm_17_GtmCcu6_Bswmd.arxml	AUTOSAR format module description file
Pwm_17_GtmCcu6_Catalog.xml	AUTOSAR format catalog file
anchors.xml	Tresos anchors support file for the PWM driver
ant_generator.xml	Tresos support file to generate and rename multiple post-build configuration when using variation point
plugin.properties	Tresos plugin support file for the PWM driver
plugin.xml	Tresos plugin support file for the PWM driver

### 1.1.4 Integration hints

This section lists the key points that an integrator or user of the PWM driver must consider.

---

**1 Pwm\_17\_GtmCcu6 driver****1.1.4.1 Intergration with AUTOSAR stack**

This section lists the modules, which are not part of MCAL, but are required to integrate the PWM driver.

- **EcuM**

The ECU Manager module is a part of the AUTOSAR stack that manages common aspects of the ECU. Specifically, in the context of MCAL, the EcuM is used for initialization and de-initialization of the software drivers. The EcuM module provided in the MCAL package is a stub code and needs to be replaced with a complete EcuM module during the integration phase.

**Initialization of PWM:**

The user of PWM driver may use APIs of EcuM to initialize the driver. The initialization of the PWM driver should be invoked from each CPU core, which intends to use the services of the PWM driver. All cores can execute initialization simultaneously.

**De-initialization of PWM:**

The user of PWM driver may use APIs of EcuM to de-initialize the driver. The de-initialization of the PWM driver should be invoked from each CPU core that uses the services of the PWM driver. All cores can execute de-initialization simultaneously.

- **Memory mapping**

Memory mapping is a concept from AUTOSAR that allows relocation of text, variables, constants and configuration data to user-specific memory regions. To achieve this, all the relocatable elements of the driver are encapsulated in different memory-section macros. These macros are defined in the `Pwm_17_GtmCcu6_MemMap.h` file.

The `Pwm_17_GtmCcu6_MemMap.h` file is provided in the MCAL package as a stub code. The integrator must place appropriate compiler pragmas within the memory-section macros. The pragmas ensure that the elements

## 1 Pwm\_17\_GtmCcu6 driver

are relocated to the correct memory region. A sample implementation listing the memory-section macros is shown as follows:

```

/**** GLOBAL RAM DATA -- NON-CACHED LMU ****/

#if defined PWM_17_GTMCCU6_START_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
/*****User pragmas here for Non-cached LMU*****/
#undef PWM_17_GTMCCU6_START_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#undef MEMMAP_ERROR
#elif defined PWM_17_GTMCCU6_STOP_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#ifdef _TASKING_C_TRICORE_
/*****User pragmas here for Non-cached LMU*****/
#undef PWM_17_GTMCCU6_STOP_SEC_VAR_CLEARED_ASIL_B_GLOBAL_UNSPECIFIED
#undef MEMMAP_ERROR

/**** CORE[x] CONFIG DATA -- PF[x] ****/ /*[x]=0..5*/

#elif defined PWM_17_GTMCCU6_START_SEC_CONFIG_DATA_ASIL_B_CORE[x]_UNSPECIFIED
/*****User pragmas here for PF[x]*****/
#undef PWM_17_GTMCCU6_START_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
#undef MEMMAP_ERROR
#elif defined PWM_17_GTMCCU6_STOP_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
/*****User pragmas here for PF[x]*****/
#undef PWM_17_GTMCCU6_STOP_SEC_CONFIG_DATA_ASIL_B_CORE0_UNSPECIFIED
#undef MEMMAP_ERROR
/**** CODE -- PF[x] ****/
#elif defined PWM_17_GTMCCU6_START_SEC_CODE_ASIL_B_GLOBAL

/*****User pragmas here for PF[x]*****/

#undef PWM_17_GTMCCU6_START_SEC_CODE_ASIL_B_GLOBAL
#undef MEMMAP_ERROR
#elif defined PWM_17_GTMCCU6_STOP_SEC_CODE_ASIL_B_GLOBAL
/*****User pragmas here for PF[x]*****/
#undef PWM_17_GTMCCU6_STOP_SEC_CODE_ASIL_B_GLOBAL
#undef MEMMAP_ERROR
#endif
#endif
#endif
#error "Pwm_17_GtmCcu6_MemMap.h, wrong pragma command"
#endif

```

- **DET**

The DET module is a part of the AUTOSAR stack that handles all the development and runtime errors reported by the BSW modules. The PWM driver reports all the development errors to the DET module through the `Det_ReportError()` API. The user of the PWM driver must process all the errors reported to the DET module through the `Det_ReportError()` API.

The `Det.h` and `Det.c` files are provided in the MCAL package as a stub code and needs to be replaced with a complete DET module during the integration phase.

- **DEM**

### 1 Pwm\_17\_GtmCcu6 driver

The DEM module is not required for the integration of the PWM driver.

- **SchM**

The SchM module is a part of the RTE that manages the BSW scheduler. The PWM driver uses the exclusive areas defined in the `SchM_Pwm_17_GtmCcu6.h` file to protect the SFRs and variables from concurrent accesses from different threads. The SchMs identified for the PWM driver are:

**HandleNotification** critical section to protect update of notification related global variable and SFRs

**PeriodAndDutyUpdate** critical section to protect update of period and duty related shadow SFRs

The `SchM_Pwm_17_GtmCcu6.h` and `SchM_Pwm_17_GtmCcu6.c` files are provided in the MCAL package as an example code and needs to be updated by the integrator. The user must implement the SchM functions defined by the PWM driver as **suspend / resume** of interrupts for the CPU on which the API is invoked. A sample implementation of the SchM functions is shown as follows:

```

/**** Sample implementation of SchM_Pwm_17_GtmCcu6.c ****/
#include "Os.h"
void SchM_Enter_Pwm_17_GtmCcu6_HandleNotification(void)
{
    /* Start of Critical Section */
    SuspendAllInterrupts();/* Suspend CPU core interrupt */
}
void SchM_Exit_Pwm_17_GtmCcu6_HandleNotification(void)
{
    /* End of Critical Section */
    ResumeAllInterrupts();/* Resume CPU core interrupt */
}
void SchM_Enter_Pwm_17_GtmCcu6_PeriodAndDutyUpdate(void)
{
    /* Start of Critical Section */
    SuspendAllInterrupts();/* Suspend CPU core interrupt */
}
void SchM_Exit_Pwm_17_GtmCcu6_PeriodAndDutyUpdate(void)
{
    /* End of Critical Section */
    ResumeAllInterrupts();/* Resume CPU core interrupt */
}

```

- **Safety error**

The PWM driver reports all the detected safety errors through the `Mcal_ReportSafetyError()` API.

The driver performs only detection and reporting of the safety errors. The handling of the reported errors shall be done by the user. The `Mcal_ReportSafetyError()` API is provided in the `Mcal_SafetyError.c` and `Mcal_SafetyError.h` files as a stub code, and must be updated by the integrator to handle the reported errors.

*Note: All DET errors are also reported as safety errors (error code used is same as DET).*

- **Notifications and callbacks**

The PWM driver does not implement any notifications. However, the PWM driver reports the rising/falling/ both edges through notification functions. These notification functions can be configured by the user in the EB Tresos for each PWM channel separately.

The PWM driver does not expect any callbacks from application but it needs a callback from the Mcu module for ISR handling.

- **Operating system(OS)**

## 1 Pwm\_17\_GtmCcu6 driver

The OS or application must ensure correct type of service and interrupt priority is configured in the SR register. Enabling and disabling of interrupts must also be managed by the OS or application.

The OS files provided by the MCAL package is only an example code and must be updated by the integrator with the actual OS files for the desired function.

### 1.1.4.2 Multicore and Resource Manager

The PWM driver supports execution of its APIs simultaneously from all CPU cores. The user should allocate logical PWM channels to the CPU cores at pre-compile time using the Resource manager module. The following are the key points to be considered with respect to multicore in the driver:

- Logical PWM channels are allocated to CPU cores at pre-compile time. For example, Pwm\_Channel0, Pwm\_Channel1
- It must be ensured that PWM channel id passed as parameter while invoking an API belongs to the same core
- DETs are raised in case APIs are invoked with mismatch of core and channel id
- Interrupts raised by a PWM channel must be serviced by the CPU core to which the channel has been allocated to
- PWM channels using GTM-ATOM, channel GTM-ATOM[i]\_CH[X] and ATOM[i]\_CH[x+1] must be allocated to the same core as these two channels share the same interrupt line
- PWM channels using GTM-TOM, channel GTM-TOM[i]\_CH[X] and TOM[i]\_CH[x+1] must be allocated to the same core as these two channels share the same interrupt line
- Locating constants, variables and configuration data to the correct memory space should be done by the user. Memory sections are marked GLOBAL (common to all cores) and CORE[x](specific to a CPU core). The following should be considered by the user to ensure better performance of the driver:

#### Code section:

The executable code of the PWM driver is placed under single MemMap section. It can be relocated to any PFlash.

#### Data section:

The RAM variable memory sections marked as specific to core should be relocated to the DSPR/DLMU of the same core. The sections marked as global should be relocated to the non-cached LMU region.

#### Configuration data and constants:

The configuration data sections marked as specific to core should be relocated to the PFlash of the same core. The sections marked as global should be relocated to the PFlash of the master core.

*Note: Relocating code, data and constants to a distant memory space would impact execution timings.*

*Note: If the driver operates from single (master) core, all the sections may be relocated to the PFlash/DSPR/DLMU of the same CPU core.*

### 1.1.4.3 MCU support

The PWM driver is dependent on the MCU driver for clock configuration, GTM timer to port pin connections and timer IP-related services. The initialization of the PWM driver must be started only after completing the MCU initialization. The following must be considered while configuring the MCU driver in tresos:

- The GTM/CCU6 hardware timers used by the PWM driver must be reserved in the MCU configuration for exclusive use by the PWM
- For signal output, the GTM timer to port pin connections should be configured in the MCU configuration for each TOM/ATOM channel allocated for PWM

#### Access of shared GTM SFRs

## 1 Pwm\_17\_GtmCcu6 driver

If channels of same the TOM/ATOM module are shared between the application and the PWM driver, the user shall ensure that shared register of TOM/ATOM modules are accessed using the MCU timer IP library APIs.

### 1.1.4.4 Port support

The PORT driver configures the port pins of the entire microcontroller. The user must configure the port pins used by the PWM driver through the PORT configuration and initialize the port pins prior to invoking the PWM initialization.

### 1.1.4.5 DMA support

The PWM driver does not use any services provided by the DMA driver.

### 1.1.4.6 Interrupt connections

The interrupt connections of the PWM driver are described in this section.

If the user wants notifications, the user should enable interrupts in the Interrupt configuration register. The interrupt configuration registers of different hardware used by PWM channels are as follows.

**Table 4 GTM interrupts**

GTM hardware used	SRC register
GTM-TOM	SRC_GTMTOMwx (w= TOM module; x= TOM Service Request)
GTM-ATOM	SRC_GTMATOMwx (w= ATOM module; x= ATOM Service Request)

**Table 5 CCU6 interrupts**

CCU6 kernel used	CCU6 comparator used	SRC register
CCU60	CCU60	SRC_CCU60SR0
CCU60	CCU61	SRC_CCU60SR1
CCU60	CCU62	SRC_CCU60SR2
CCU60	CCU63	SRC_CCU60SR3
CCU61	CCU60	SRC_CCU61SR0
CCU61	CCU61	SRC_CCU61SR1
CCU61	CCU62	SRC_CCU61SR2
CCU61	CCU63	SRC_CCU61SR3

The MCU driver through its timer-related services provides interrupt handler for GTM and CCU6 timers.

All the ISRs to the GTM must be routed to the Mcu\_17\_Gtm\_TomChannelIsr OR Mcu\_17\_Gtm\_AtomChannelIsr API, which further invokes Pwm\_17\_GtmCcu6\_Timer\_Isr.

All the ISRs to the CCU6 must be routed to the Mcu\_17\_Ccu6\_ChannelIsr API, which further invokes Pwm\_17\_GtmCcu6\_Timer\_Isr. An example ISR handling is shown as follows.

**1 Pwm\_17\_GtmCcu6 driver**

```
/* include MCU timer header file */
#include "Mcu_17_TimerIp.h"
/*****SRC_ GTMTOM0SR0*****/
ISR(GTMTOM0SR0_ISR)
{
    /* Enable Global Interrupts */
    ENABLE();

    /* Parameter is Channel Number */
    Mcu_17_Gtm_TomChannelIsr (TOM_MODULE_0 , TOM_CHANNEL_0);
    /* TOM_MODULE_0 = 0, TOM_CHANNEL_0 = 0 */
}

/*****SRC_ CCU60SR0*****/
ISR(CCU60SR0_ISR){
    /* Enable Global Interrupts */
    ENABLE();

    /* Parameter is Channel Number */
    Mcu_17_Ccu6_ChannelIsr(CCU6_KERNEL_0,CCU6_CHANNEL_0);
}
```

## 1 Pwm\_17\_GtmCcu6 driver

### 1.1.4.7 Example usage

#### Driver initialization

The following code listing shows the steps involved in the initialization of the PWM driver.

```
#include "Mcu.h"
#include "Irq.h"
#include "Port.h"
#include "Pwm_17_GtmCcu6.h"

Mcu_Init(&Mcu_Config);
Mcu_InitClock(0);
while(Mcu_GetPllStatus() != MCU_PLL_LOCKED);
Mcu_DistributePllClock();
/* Configure Interrupt priority */
IrqGtm_Init();
/* Port Initialization */
Port_Init(&Port_ConfigRoot);
/* Pwm Initialization */
Pwm_17_GtmCcu6_Init(&Pwm_17_GtmCcu6_Config);
```

After invoking the `Pwm_17_GtmCcu6_Init` API, the PWM output signals are generated for the configured duty and period.

*Note: User must ensure that the `Pwm_17_GtmCcu6_Init` API is called before using any other runtime APIs provided by the PWM driver.*

#### Driver de-initialization

The following code listing depicts the steps involved in the de-initialization of the PWM driver.

*Note: De-initializing the PWM driver will put all the channels to the idle state.*

```
/* De-initialize PWM driver */
Pwm_17_GtmCcu6_DeInit();
/* Pwm Channel output is set to Idle */
```

#### Set duty cycle

The following code snippet shows invoking of the `Pwm_17_GtmCcu6_SetDutyCycle` API.

```
/* Change Duty to 25% when PwmDutyShiftInTicks is OFF*/
Pwm_17_GtmCcu6_SetDutyCycle(0,0x2000);
/* Change Duty to 25% when PwmDutyShiftInTicks is ON*/
/* For channel 0, the period is 48, 25% would result in 12 ticks */
Pwm_17_GtmCcu6_SetDutyCycle(0,12);
```

#### Set period and duty cycle

## 1 Pwm\_17\_GtmCcu6 driver

The following code snippet shows invoking of Pwm\_17\_GtmCcu6\_SetDutyCycle API.

```
/* Change Duty to 25% and period 60 ticks for channel 4 when PwmDutyShiftInTicks is OFF */
Pwm_17_GtmCcu6_SetPeriodAndDuty(4,60,0x2000);
/* Change Duty to 25% and period 60 ticks for channel 4 when PwmDutyShiftInTicks is ON */
/* For Period 60, 25% would result in 15 ticks */
Pwm_17_GtmCcu6_SetPeriodAndDuty(4,60,15);
```

### Notification, set idle and get output state

The following code listing shows invoking of the notification APIs, Pwm\_17\_GtmCcu6\_SetOutputToIdle and Pwm\_17\_GtmCcu6\_GetOutputState API.

```
/* Pwm Initialization */
Pwm_17_GtmCcu6_Init(&Pwm_Config);
/* Enable Notification for channel 3 */
Pwm_17_GtmCcu6_EnableNotification(3,PWM_RISING_EDGE);
/* Disable Notification for channel 3 */
Pwm_17_GtmCcu6_DisableNotification(3);
/* Set Output of channel 3 to Idle */
Pwm_17_GtmCcu6_SetOutputToIdle(3);
/* Get Output State of channel 3 */
/* Here variable 'State' holds the output state of channel 3 */
State = Pwm_17_GtmCcu6_GetOutputState(3);
```

## 1.1.5 Key architectural considerations

### 1.1.5.1 User mode support

The PWM driver operates in both User-1 and Supervisor modes without the need of any configuration parameter to configure the behavior.

[cover parentID PWM={1A65EADD-AFD0-4845-B2D2-8257E086DD67}]

[cover parentID PWM={ED41EDC1-CB6C-4821-BED8-1735365FE93D}]

## 1 Pwm\_17\_GtmCcu6 driver

### 1.2 Assumptions of Use (AoU)

The AoU for the PWM driver are as follows.

- **Channel allocation to cores**

Integrator shall ensure the following points while allocating channels to cores:

- If the PwmHandleShiftByOffset configuration parameter is set to ON, all GTM channels of TGC/AGC should be allocated to the same core. This will enable synchronous start of all channels in same TGC/AGC
- For PWM channels of type GTM, Channel x and Channel x+1 of same TGC/AGC shall be allocated to same core, as they share same interrupt node
- To enable synchronous start of CCU6 channels, all CCU6 channels of the kernel shall be allocated to same core

[cover parentID PWM={A1C61D00-C7D6-49cc-B0AE-CEF01CC900D4}]

- **Config pointer to initialization**

When the PWM driver is used in the multicore environment, user has to ensure that the same configuration pointer is passed to the initialization function from different cores.

[cover parentID PWM={170B536A-4745-4890-87FD-6155B7B45F0E}]

- **InitCheck Sequence**

User shall invoke Pwm\_17\_GtmCcu6\_InitCheck to ensure the initialization is done correctly.

The parameter PwmInitCheckApi shall be enabled and the user of PWM shall call InitCheck function before the execution of any runtime API (except GetVersionInfo) but after completion of PWM initialization sequence.

[cover parentID PWM={EB6F93B4-566D-455e-8354-D7EDB0C8A6DA}]

- **ConfigPtr passed to InitCheck**

User of PWM shall ensure that InitCheck is invoked with the same ConfigPtr that is used in Init.

[cover parentID PWM={459CF196-ED9B-4c74-B268-16B94B3EB727}]

- **Notification when duty is 0% or 100%**

Decision: When notification for duty 0% or 100% is enabled by the user for fixed and variable period channels then the following notification combination shall be used.

- Duty is 0%:
  - Polarity - high, notify value - rising edge
  - Polarity - low, notify value - falling edge
- Duty is 100%:
  - Polarity - high, notify value - falling edge
  - Polarity - low, notify value - rising edge

The notify value is the input parameter for the Pwm\_17\_GtmCcu6\_EnableNotification function.

Rational: If both edges are enabled for 0% or 100 % duty, the differentiation of edges is not possible.

[cover parentID PWM={B1EE9B66-F309-4a94-BBCC-8487D15184C3}]

- **ShiftOffset = ON for shifted channels**

If the shifted PWM channels are used then it is recommended to set the PwmHandleShiftByOffset configuration parameter to ON. If PwmHandleShiftByOffset is set to OFF, the shifted period channels start late compared to the reference channel due to which the first period of shifted period channels may not match the period of the reference channel.

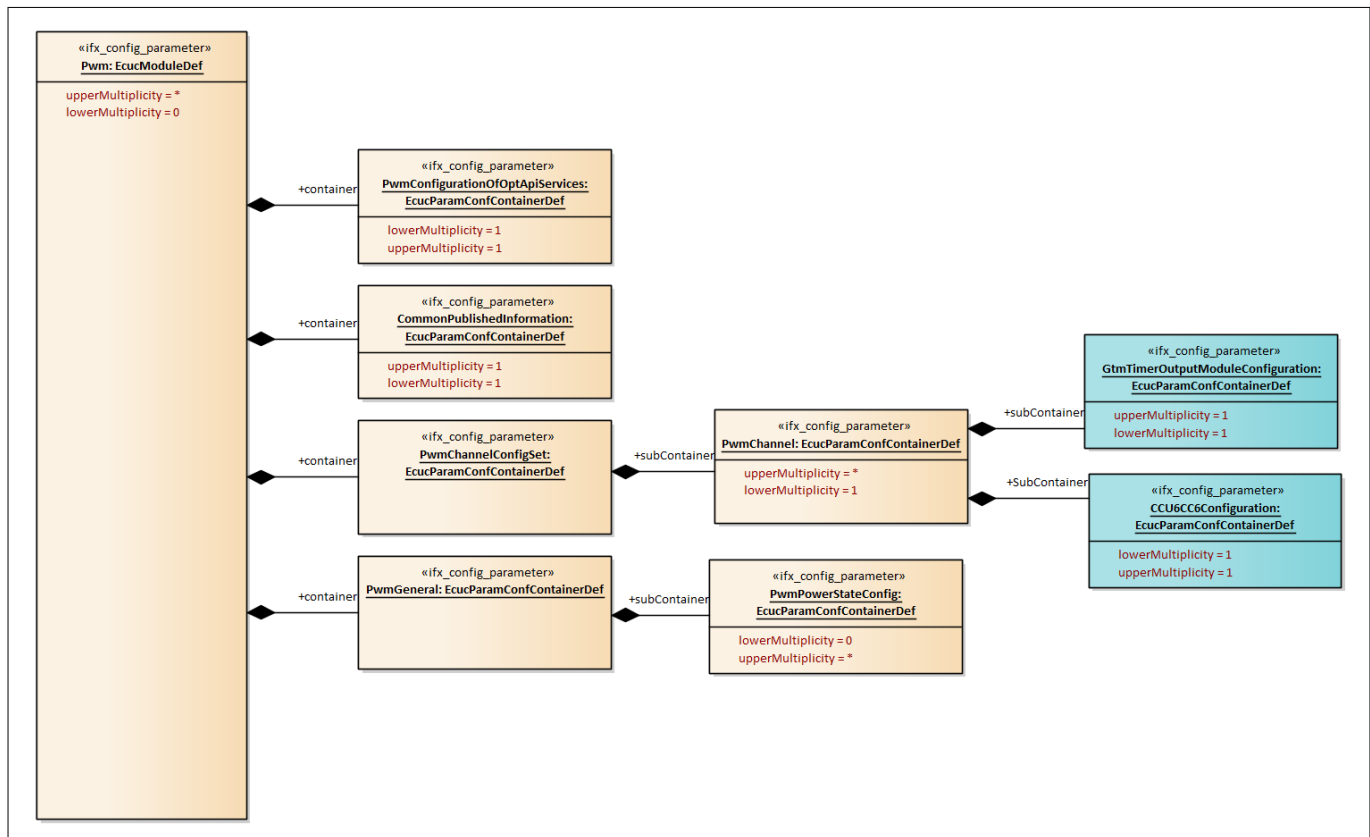

[cover parentID PWM={05182FFE-74CA-4bf4-AE87-BD22DE99E628}]

**1.3.2 Functions - Type definitions**

This section lists the data types of the PWM driver.

**1.3.2.1 Pwm\_17\_GtmCcu6\_ChannelType**
**Table 62 Specification for Pwm\_17\_GtmCcu6\_ChannelType**

<b>Syntax</b>	Pwm_17_GtmCcu6_ChannelType	
<b>Type</b>	uint8	
<b>File</b>	Pwm_17_GtmCcu6.h	
<b>Range</b>	0-199	The range is for the number of TOM channels, ATOM channels and CCU6 channels for the device variant. The maximum number of channels will vary depending on the device variant. 200 is for the superset device variant.
<b>Description</b>	Specifies the identification (ID) for a channel.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Pwm\_17\_GtmCcu6 driver**
**1.3.2.2 Pwm\_17\_GtmCcu6\_NotifiPtrType**
**Table 63 Specification for Pwm\_17\_GtmCcu6\_NotifiPtrType**

<b>Syntax</b>	Pwm_17_GtmCcu6_NotifiPtrType
<b>Type</b>	Pointer to a function of type void Function_Name ( void )
<b>File</b>	Pwm_17_GtmCcu6.h
<b>Description</b>	Channel notification function pointer
<b>Source</b>	AUTOSAR
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.

**1.3.2.3 Pwm\_17\_GtmCcu6\_PeriodType**
**Table 64 Specification for Pwm\_17\_GtmCcu6\_PeriodType**

<b>Syntax</b>	Pwm_17_GtmCcu6_PeriodType	
<b>Type</b>	uint32	
<b>File</b>	Pwm_17_GtmCcu6.h	
<b>Range</b>	0-16777215	Range: 0 to 0xFFFF for TOM/CCU6 0 to 0xFFFFFFFF for ATOM
<b>Description</b>	Definition of the period of a PWM channel	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.4 Pwm\_17\_GtmCcu6\_OutputStateType**
**Table 65 Specification for Pwm\_17\_GtmCcu6\_OutputStateType**

<b>Syntax</b>	Pwm_17_GtmCcu6_OutputStateType	
<b>Type</b>	uint8	
<b>File</b>	Pwm_17_GtmCcu6.h	
<b>Range</b>	PWM_17_GTMCCU6_HIGH	The PWM channel is in the high state. The PWM channel output will be in the high state (3 or 5 V).
	PWM_17_GTMCCU6_LOW	The PWM channel is in low state. The PWM channel output will be in the low state (0 V).
<b>Description</b>	Output state of a PWM channel. Note that this will be read from the output state on the TOM or ATOM channel connected to the port pin. This will not be read directly from the port pin. However, both will be the same. This type is used to read PwmPolarity and PwmIdleState.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1 Pwm\_17\_GtmCcu6 driver**
**1.3.2.5 Pwm\_17\_GtmCcu6\_EdgeNotificationType**
**Table 66 Specification for Pwm\_17\_GtmCcu6\_EdgeNotificationType**

<b>Syntax</b>	Pwm_17_GtmCcu6_EdgeNotificationType	
<b>Type</b>	uint8	
<b>File</b>	Pwm_17_GtmCcu6.h	
<b>Range</b>	PWM_17_GTMCCU6_RISING_EDGE	Notification is called when the rising edge occurs on the PWM output signal.
	PWM_17_GTMCCU6_FALLING_EDGE	Notification is called when the falling edge occurs on the PWM output signal.
	PWM_17_GTMCCU6_BOTH_EDGES	Notification is called when both the rising and falling edge occur on the PWM output signal.
<b>Description</b>	Definition of the type of edge notification of a PWM channel. The edges are passed in the Pwm_17_GtmCcu6_EnableNotification() API.	
<b>Source</b>	AUTOSAR	
<b>Autosar Version</b>	Applicable for Autosar versions 4.2.2 and 4.4.0.	

**1.3.2.6 Pwm\_17\_GtmCcu6\_ChannelClassType**

<b>PWM_17_GTMCCU6_E_PERIOD_UNCHANGEABLE:</b> Error is reported when usage of unauthorized PWM service on PWM channel configured with a fixed period.	AUTOSAR	0x13	DET_SAFETY	0x13	DET_SAFETY
<b>PWM_17_GTMCCU6_E_UNINIT:</b> Error is reported when the API service is used without module initialization.	AUTOSAR	0x11	DET_SAFETY	0x11	DET_SAFETY

### 1.3.9 Deviations and limitations

This section describes the deviations and limitations of the PWM driver.

#### 1.3.9.1 Deviations

This section describes the deviations of the PWM driver.

##### 1.3.9.1.1 Software specification deviations

This section describes the deviations from software specification.

**1 Pwm\_17\_GtmCcu6 driver**
**Table 80 Known deviations**

Reference	Deviation
ECUC_Pwm_00124 :PwmPeriodDefault	According to AUTOSAR specification, period value is entered in seconds, instead PWM driver expects value to be entered in ticks.
PWM_FIXED_PERIOD_CENTER_ALIGNED	PWM_FIXED_PERIOD_CENTER_ALIGNED range is added along with the other AUTOSAR ranges as microcontroller specific feature.
Safety error for unintended service request	Refer to Reporting of unintended service requests.
Pwm_DeInit - Actions: SWS_Pwm_00010	During de-initialization, SL bit of channel CTRL SFR is updated based on idle state to ensure the channel output signal is at idle state.

**1.3.9.1.2 AMDC Violations**

This section describes the violations reported by the vector AMDC checker tool with respect to AUTOSAR.

**Table 81 Violations reported by AMDC checker tool for A202**

AMDC Rule	A202
Description	AUTOSAR insists period value to be given in terms of seconds. But in current PWM implementation due to support of Non-Autosar requirement i.e PwmDutyShiftInTicks parameter. The period value is given in terms of ticks, hence PwmPeriodDefault type is changed to Integer.

**Table 82 Violations reported by AMDC checker tool for A207**

AMDC Rule	A207
Description	<p>To support Non-Autosar requirement i.e PwmDutyShiftInTicks is ON range of PwmDutycycleDefault parameter should be 24 bit. Therefore for this parameter max value for range attribute is deviated from AUTOSAR. Refer below for additional details.</p> <ul style="list-style-type: none"> <li>- When PwmDutyShiftInTicks is OFF, the value is relative to period. (Autosar range 16 bit) 0 to 0x8000</li> <li>- When PwmDutyShiftInTicks is ON, the value is in absolute ticks. (Non Autosar range 24 bit)</li> <li>- 0 to 0x8000 if PwmDutyShiftInTicks is STD_OFF for TOM/ATOM/CCU6</li> <li>- 0 to 0xFFFF if PwmDutyShiftInTicks is STD_ON and the module is TOM/CCU6</li> <li>- 0 to 0xFFFFF if PwmDutyShiftInTicks is STD_ON and the module is ATOM</li> </ul>

**1 Pwm\_17\_GtmCcu6 driver**
**1.3.9.1.3 VSMD Violations**

This section describes the violations reported by the EB VSMD checker tool with respect to AUTOSAR.

**Table 83 Violations reported by VSMD checker tool for EcucSws\_1007**

Rule ID:	EcucSws_1007
VSMD Node(s):	/AURIX2G/EcucDefs/Pwm/PwmChannelConfigSet/ PwmChannel/PwmDutycycleDefault
Description:	For Integer and Float Parameters the MIN values must be $\geq$ and the MAX values $\leq$ as in the StMD.
Additional Information:	<p>To support Non-Autosar requirement i.e PwmDutyShiftInTicks is ON range of PwmDutycycleDefault parameter should be 24 bit. Therefore for this parameter max value for range attribute is deviated from AUTOSAR. Refer below for additional details.</p> <ul style="list-style-type: none"> <li>- When PwmDutyShiftInTicks is OFF, the value is relative to period. (Autosar range 16 bit) 0 to 0x8000</li> <li>- When PwmDutyShiftInTicks is ON, the value is in absolute ticks. (Non Autosar range 24 bit)</li> <li>- 0 to 0x8000 if PwmDutyShiftInTicks is STD_OFF for TOM/ATOM/CCU6</li> <li>- 0 to 0xFFFF if PwmDutyShiftInTicks is STD_ON and the module is TOM/CCU6</li> <li>- 0 to 0xFFFFF if PwmDutyShiftInTicks is STD_ON and the module is ATOM</li> </ul>

**Table 84 Violations reported by VSMD checker tool for EcucSws\_1008**

Rule ID:	EcucSws_1008
VSMD Node(s):	/AURIX2G/EcucDefs/Pwm/PwmChannelConfigSet/ PwmChannel/PwmPeriodDefault
Description:	For Containers, Parameters and References the parameter type may stay the same or may be changed to the corresponding derived-type in the VSMD.
Additional Information:	AUTOSAR insists period value to be given in terms of seconds. But in current PWM implementation due to support of Non-Autosar requirement i.e PwmDutyShiftInTicks parameter. The period value is given in terms of ticks, hence PwmPeriodDefault type is changed to Integer.

**1.3.9.2 Limitations**

This section describes the limitations of PWM driver.

**PWM driver limitation:**

### 1 Pwm\_17\_GtmCcu6 driver

- Fixed period center-aligned channels should be present in the same TGC/AGC of the same TOM/ATOM module where the referenced fixed period channel is present.
- The transition from 100% to other percentages with the shift value will not be the same as the ideal case: The transition from 100% to other percentages with a shift will not happen as per expected signal in case of coherent update. This is because three signal level changes are needed to produce the expected waveform. The registers CM0 and CM1 are updated from shadow registers at the end of the cycle. The signal will remain in the same level till the CM0 value is reached, as shown in the following diagram.

*Note: This limitation is also applicable for cases where call is made from the Pwm\_17\_GtmCcu6\_SetOutputToIdle API to some other duty.*

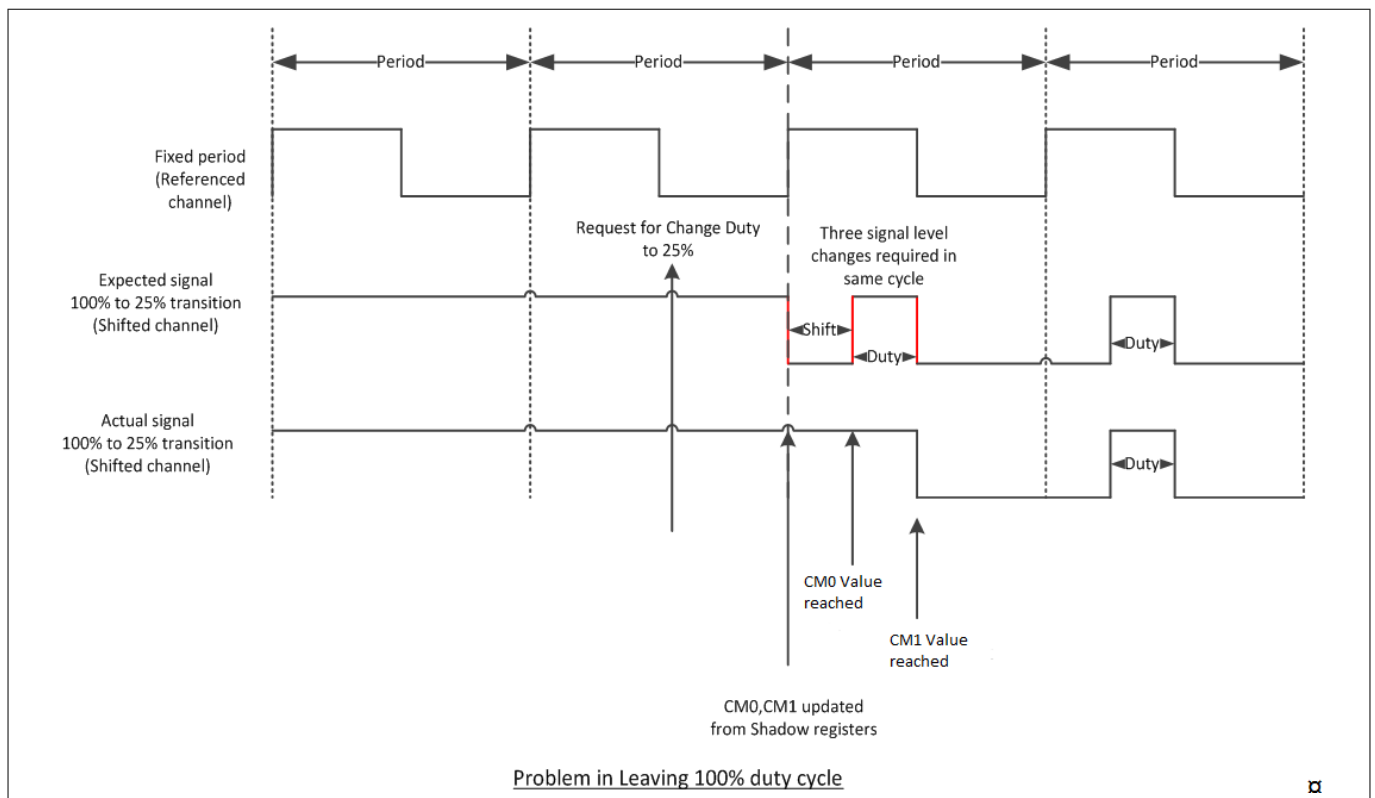

*Note:*

CM0 - Period Match register

CM1- Duty Match register

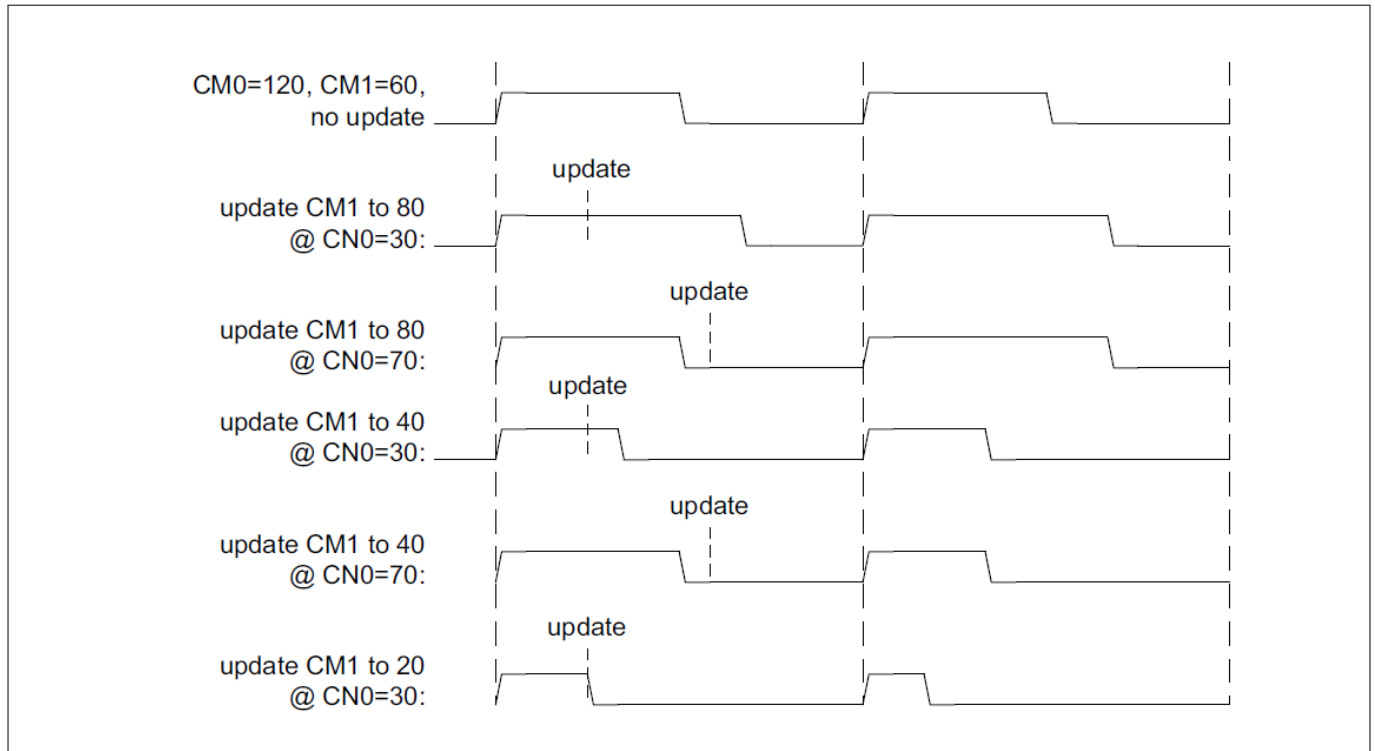

SR0 - Period Match Shadow register

SR1 - Duty Match Shadow register

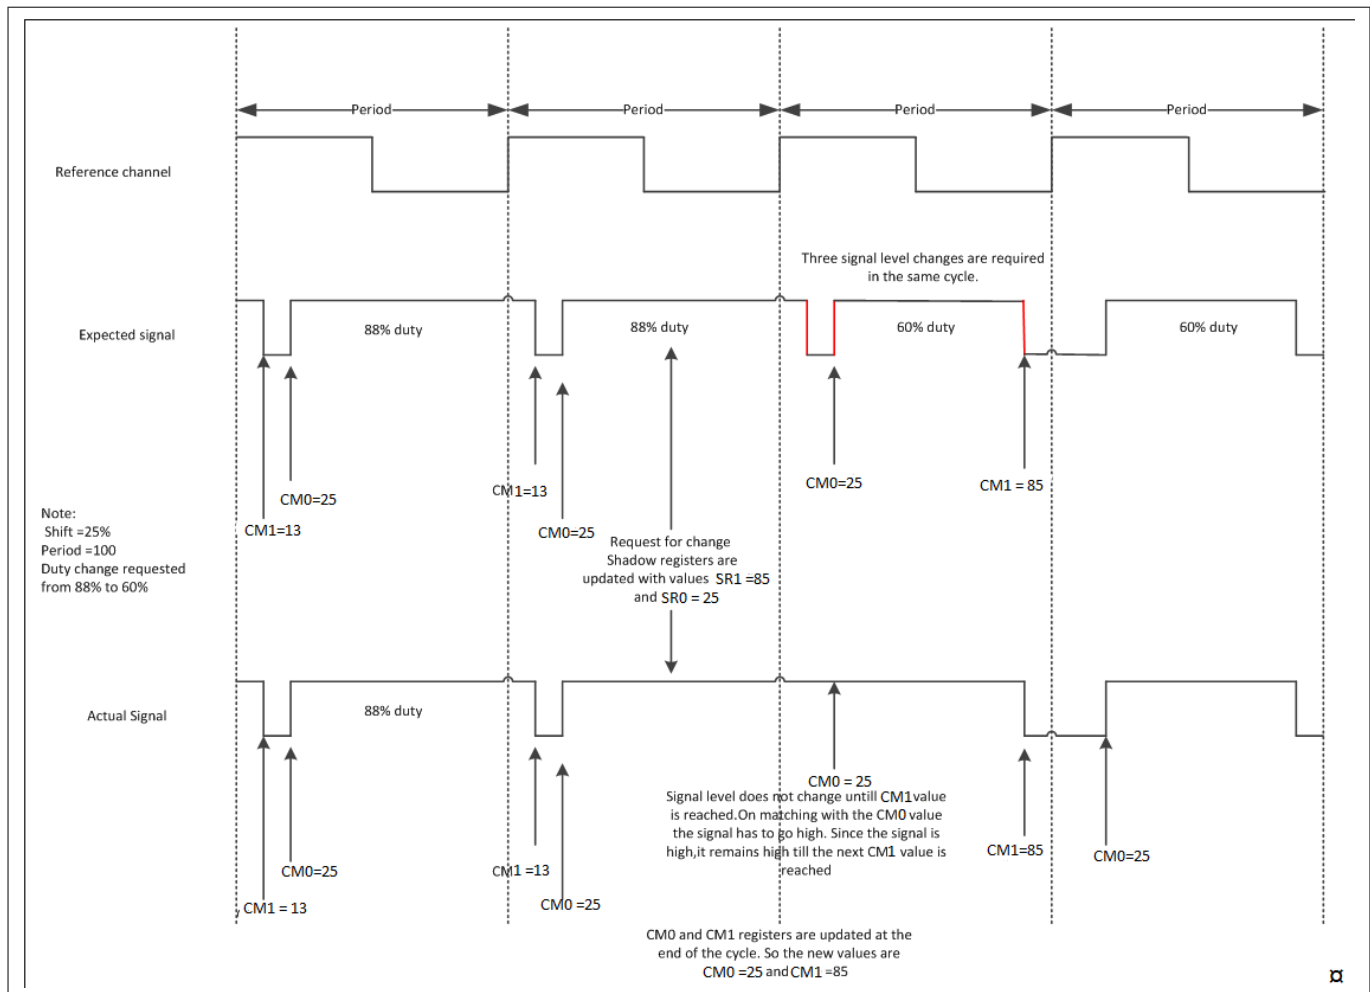

**Figure 5 Transition from 100% to other percentages with a shift value**

- In case of non-coherent update the register CMx (CM0 period and CM1 duty) are updated directly (applicable for Pwm\_17\_GtmCcu6\_SetDutyCycle, Pwm\_17\_GtmCcu6\_SetPeriodAndDuty and Pwm\_17\_GtmCcu6\_SetOutputToIdle APIs). Depending on the point of time of the update of CMx registers in relation to the actual values of CN0 and CMx, the new duty cycle is applied in the current period or the following period. The new duty cycle may jitter from update to update by a maximum of one period. Refer the following diagram. For shifted and center aligned channels update will be done with respect to period of reference fixed period channel.

**1 Pwm\_17\_GtmCcu6 driver**

**Figure 6 Non-coherent update of duty-cycle**

- In case of coherent updated shifted channels where shift is not equal to zero, when duty change is requested from a condition where shift + duty is greater than period to shift + duty less than period then the signal will remain on duty for more than a period value. Refer figure below. If a request is made to change the duty from the condition shift and duty-cycle value together is greater than period ( $\text{Shift} + \text{Duty} > \text{Period}$ ) to less than period ( $\text{Shift} + \text{Duty} < \text{Period}$ ) in the case for a coherent updated shifted channel where shift value is not equal to zero, the following behavior will be observed.

**1 Pwm\_17\_GtmCcu6 driver**

**Figure 7 Duty update with a shift value behavior**

In this diagram, on compare match with CM0 value the signal will go high and on compare match with CM1 value the signal will go low. The values are calculated as  $CM0/SR0 = \text{Shift}$  and  $CM1/SR1 = (\text{Shift} + \text{Duty \% period})$ . Here in the figure initially 88% duty was requested and shift was 25%. So if the period is 100 ticks then,  $CM0 = 25$  and  $CM1 = 13$  ( $(25+88) \% 100$ ). Later when the duty of 60% is requested the values calculated are  $SR0 = 25$  (Shift) and  $SR1 = 85$  using  $((25+60) \% 100)$ .

The CM1 and CM0 values are updated from Shadow registers SR1 and SR0 respectively (in the case of coherent update). When the duty change is requested then the function `Pwm_17_Gtm_SetDutyCycle` will update the corresponding shadow registers and return immediately after completion of the function. The updating of shadow registers to CM0 and CM1 registers will happen only after the end of the period.

Since the new values are updated to CM1 register from shadow register the signal will remain in the same state till the CM1 value is reached as shown in the figure. The signal will remain high for a time greater than period as shown in the figure above because there are three signal level changes required in the same cycle which could not be handled with two values CM0 and CM1 available at our disposal.

- In case shifted channels (`PwmHandleShiftByOffset = true`) the changes will be happened by the end of the period of the same channel. It will not depend on the reference channel. The limitations in table below are also applicable. Background: A global configuration parameter has been added `PwmHandleShiftByOffset` in the `PwmGeneral` container and once this parameter is selected then the shifted channels are configured similar to fixed period channels and but they are started by an offset. The offset is calculated by  $\text{offset} = \text{period} - \text{shift}$ . This offset acts as the required shift. All the channels in the TGC where these kind of shifted channels are present are triggered by a global host trigger. This host trigger will help in enabling all the channels in the TGC at the same time, and since all the channels are started the same time the

**1 Pwm\_17\_GtmCcu6 driver**

corresponding shift is achieved accordingly. Please refer to respective API's to know how these kind of shifted channels are handled.

**Table 85 Difference between the two types of handling for shifted channels**

Subject	FPS(PwmHandleShiftByOffset=false)	FPS(PwmHandleShiftByOffset=true)
Handling of shift	Compare register is used	Counter register is preloaded with period - shift
Handling of period	Fixed period reference channel's compare register is used	No reference channel, same channels compare register is used, however in configuration reference channel is provided for AUTOSAR compatibility
Host trigger	Host trigger is not used	Host trigger is used.
TGC/AGC restriction due to host trigger	Channels in the same TGC can be shared across other drivers.	Channels in the same TGC cannot be shared across other drivers.
Handling of shift + duty crossing period	For more than one cycle the output line is either high or low during change of duty	No limitation in this case.
Leaving 100% duty cycle	The signal will remain in the 100% duty till the next compare value is reached; The shift will not be visible.	The signal will remain in the 100% duty till the next compare value is reached; The shift will not be visible.
Update of new duty cycle	In case of coherent update the new duty cycle always happens at the end of reference channel period	In case of coherent update the new duty cycle happens at the end of its own period. This means in corner cases the new duty cycle might happen in the same cycle of the configured reference channel.
Pwm_17_GtmCcu6_SetOutputToldl e function	Always happens in the next cycle.	Always happens in the next cycle.
Update of 0% and 100% duty cycle	Happens at the start of the next cycle of reference channel	Happens at the start of the next cycle after the shift value is elapsed.
Handling of shift + duty exactly equal to period	For more than one cycle an incorrect duty cycle could be observed when a transition is asked from API Pwm_17_GtmCcu6_SetOutputToldl e or during change of duty to 100%	No limitation in this case

- Channels of TGC or AGC can be shared across other drivers but users of the other drivers or within the PWM driver should not introduce the sequence of referenced fixed period and fixed period shifted channels when PwmHandleShiftByOffset parameter is FALSE or referenced fixed period and fixed period center-aligned channels in-between the other channels sequence. This is because, introducing channel sequence in-between will break the sequence of other channels.
- User shall consider the following points when PwmHandleShiftByOffset is TRUE:

## 1 Pwm\_17\_GtmCcu6 driver

- To ensure synchronous start of all the shifted channels at the same time, configure all the shifted channels including the fixed period channel in the same TGC or AGC module (Recommended).
- If maximum shifted channels and fixed period channel are configured across the TGC module numbers or AGC module numbers, there could be a delay on the shifted channels based on the execution time of the PWM initialization sequence.
- User can measure the actual offset during the PWM initialization and compensate the delay of the shifted channels accordingly in the configuration.
- Execution time depends on the initialization sequence and number of Host-Triggers.

### PWM Initialization Sequence:

- Driver initializes all the relevant registers of the configured hardware with the values passed in the configuration pointer structure before generating the PWM signal.
- Driver performs the Host-Trigger when PwmHandleShiftByOffset is TRUE to generate the PWM signal. i.e,
- Loop from lowest configured TOM module to the highest configured TOM module
- Host-trigger of TGC0 for current TOM
- Host-trigger of TGC1 for current TOM
- Loop from lowest configured ATOM module to the highest configured ATOM module
- Host-trigger of AGC for current ATOM
- When notification for 0% or 100% is enabled by the user for fixed and variable period channels the notification for falling edge does not work for 0% duty for polarity high, similarly rising edge notification will not work 0% duty for polarity low, however the user can configure notification as both edges to get notification without worrying about the polarity.
- For fixed and variable period channels when notification is asked for falling edge for a channel whose polarity is HIGH and idle state LOW after calling SetOutputToIdle function, notifications are not generated. Similarly if a channel with polarity LOW and idle state HIGH and rising edge notification is asked, notification is not generated. This is because internally SetOutputToIdle function moves to 0% or 100% duty based on IDLE state and polarity.
- In case of non-coherent PWM channel with polarity PWM\_LOW and idle state PWM\_HIGH, when transition from idle state to non-zero duty cycle state, with rising edge notification enabled, a notification is provided even when there is no rising edge in the first cycle only, this due to CM1 compare match.
- In case of coherent PWM channel with polarity PWM\_LOW and idle state PWM\_LOW, when transition from idle state to non-zero duty cycle state, with rising edge notification enabled, a notification is provided even when there is no rising edge in the first cycle only, this due to CM0 compare match.
- Set output to idle for CCU6 channels

Applicable APIs: Pwm\_17\_GtmCcu6\_SetOutputToIdle and Pwm\_17\_GtmCcu6\_DeInit.

Behavior1:

Precondition: Polarity is HIGH and idle state is LOW

If set to idle is called when current state is HIGH, then switch to idle occurs after a delay due to hardware limitation.

Behavior2:

Precondition: Polarity is LOW and Idle State is HIGH.

If set to idle is called when current state is LOW, then switch to idle occurs after a delay due to hardware limitation.

Hardware Limitation: Duty and period values cannot be updated directly to running register.

Workaround in design is to stop the timer, update new values and perform shadow transfer, which leads to delay.

[cover parentID PWM={A0182969-A76A-4eee-AEF8-0FEE0170C4CE}]

---

**1 Pwm\_17\_GtmCcu6 driver**

- CCU6 Configuration:  
Non-coherent update of duty cycle and period is not supported for PWM channels of type CCU6.  
Centre aligned channels is not supported for PWM channel of type CCu6.
- For PWM channels of type CCU6, the first cycle will have period value as period+1 instead of period.
- Callback notification for a TOM or ATOM channel will be invoked by DSADC and not by PWM, when for the channel `McuTomChannelEventHandledByDsadc = ON` or `McuAtomChannelEventHandledByDsadc = ON` respectively.
